

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PART I—GREAT BATTLES OF THE WESTERN ARMIES

CHAPTER I

ATTACK ON BELGIUM

THE first great campaign on the western battle grounds in the European War began on August 4, 1914. On this epoch-making day the German army began its invasion of Belgium—with the conquest of France as its ultimate goal. Six mighty armies stood ready for the great invasion. Their estimated total was 1,200,000 men. Supreme over all was the Emperor as War Lord, but Lieutenant General Helmuth von Moltke, chief of the General Staff, was the practical director of military operations. General von Moltke was a nephew of the great strategist of 1870, and his name possibly appealed as of happy augury for repeating the former capture of Paris.

The First Army was assembled at Aix-la-Chapelle in the north of Belgium, within a few miles of the Dutch frontier. It was under the command of General von Kluck. He was a veteran of both the Austrian and Franco-Prussian Wars, and was regarded as an able infantry leader. His part was to enter Belgium at its northern triangle, which projects between Holland and Germany, occupy Liege, deploy on the great central plains of Belgium, then sweep toward the French northwestern frontier in the German dash for Paris and the English Channel. His army thus formed the right wing of the whole German offensive. It was composed of picked corps, including cavalry of the Prussian Guard.

The Second Army had gathered in the neighborhood of Lim-

bourg under the command of General von Bülow. Its advance was planned down the valleys of the Ourthe and Vesdre to a junction with Von Kluck at Liege, then a march by the Meuse Valley upon Namur and Charleroi. In crossing the Sambre it was to fall into place on the left of Von Kluck's army.

The German center was composed of the Third Army under Duke Albrecht of Württemberg, the Fourth Army led by the crown prince, and the Fifth Army commanded by the Crown Prince of Bavaria. It was assembled on the line Neufchateau-Treves-Metz. Its first offensive was the occupation of Luxemburg. This was performed, after a somewhat dramatic protest by the youthful Grand Duchess, who placed her motor car across the bridge by which the Germans entered her internationally guaranteed independent state. The German pretext was that since Luxemburg railways were German controlled, they were required for the transport of troops. Preparations were then made for a rapid advance through the Ardennes upon the Central Meuse, to form in order upon the left of Von Bülow's army. A part of the Fifth Army was to be detached for operations against the French fortress of Verdun.

The Sixth Army was concentrated at Strassburg in Alsace, under General von Heeringen. As inspector of the Prussian Guards he bore a very high military reputation. For the time being General von Heeringen's part was to remain in Alsace, to deal with a possibly looked for strong French offensive by way of the Vosges or Belfort.

The main plan of the German General Staff, therefore was a wide enveloping movement by the First and Second Armies to sweep the shore of the English Channel in their march on Paris, a vigorous advance of the center through the Ardennes for the same destination, and readiness for battle by the Sixth Army for any French force which might be tempted into Alsace. That this plan was not developed in its entirety, was due to circumstances which fall into another place.

The long anticipated *Day* dawned. Their vast military machine moved with precision and unity. But there was a sur-

PICTORIAL MAP OF FRANCE

prise awaiting them. The Belgians were to offer a serious resistance to passage through their territory—a firm refusal had been delivered at the eleventh hour. The vanguard was thrown forward from Von Kluck's army at Aix, to break through the defenses of Liege and seize the western railways. This force of three divisions was commanded by General von Emmich, one of them joining him at Verviers.

On the evening of August 3, 1914, Von Emmich's force had crossed into Belgium. Early on the morning of August 4, 1914, Von Kluck's second advance line reached Visé, situated on the Meuse north of Liege and close to the Dutch frontier. Here an engagement took place with a Belgian guard, which terminated with the Germans bombarding Visé. The Belgians had destroyed the river bridge, but the Germans succeeded in seizing the crossing.

This was the first actual hostility of the war on the western battle grounds. With the capture of Visé, the way was clear for Von Kluck's main army to concentrate on Belgian territory. By nightfall, Liege was invested on three sides. Only the railway lines and roads running westward remained open.

CHAPTER II

SIEGE AND CAPTURE OF LIEGE

A VIEW of Liege will assist in revealing its three days' siege, with the resulting effect upon the western theatre of war. Liege is the capital of the Walloons, a sturdy race that in times past has at many a crisis proved unyielding determination and courage. At the outbreak of war it was the center of great coal mining and industrial activity. In the commercial world it is known everywhere for the manufacture of firearms. The smoke from hundreds of factories spreads over the city, often hanging in dense clouds. It might aptly be termed the Pittsburg of Belgium. The city lies in a deep, broad cut of the River Meuse,

at its junction with the combined channels of the Ourthe and Vesdre. It stretches across both sides, being connected by numerous bridges, while parallel lines of railway follow the course of the main stream. The trunk line from Germany into Belgium crosses the Meuse at Liege. For the most part the old city of lofty houses clings to a cliffside on the left bank, crowned by an ancient citadel of no modern defensive value. Whatever picturesqueness Liege may have possessed is effaced by the squalid and dilapidated condition of its poorer quarters. To the north broad fertile plains extend into central Belgium, southward on the opposite bank of the Meuse, the Ardennes present a hilly forest, stream-watered region. In its downward course the Meuse flows out of the Liege trench to expand through what is termed the Dutch Flats.

Liege, at the outbreak of the war, was a place of great wealth and extreme poverty—a Liege artisan considered himself in prosperity on \$5.00 a week. It was of the first Belgian strategic importance. Its situation was that of a natural fortress, barring the advance of a German army.

The defenses of Liege were hardly worth an enemy's gunfire before 1890. They had consisted of a single fort on the Meuse right bank, and the citadel crowning the heights of the old town. But subsequently the Belgian Chamber voted the necessary sums for fortifying Liege and Namur on the latest principles. From the plans submitted, the one finally decided upon was that of the famous Belgian military engineer Henri Alexis Brialmont. His design was a circle of detached forts, already approved by German engineers as best securing a city within from bombardment. With regard to Liege and Namur particularly, Brialmont held that his plan would make passages of the Meuse at those places impregnable to an enemy.

When the German army stood before Liege on this fourth day of August, in 1914, the circumference of the detached forts was thirty-one miles with about two or three miles between them, and at an average of five miles from the city. Each fort was constructed on a new model to withstand the highest range and power of offensive artillery

forecast in the last decade of the nineteenth century. When completed they presented the form of an armored mushroom, thrust upward from a mound by subterranean machinery. The elevation of the cupola in action disclosed no more of its surface than was necessary for the firing of the guns. The mounds were turfed and so inconspicuous that in times of peace sheep grazed over them. In Brialmont's original plan each fort was to be connected by infantry trenches with sunken emplacements for light artillery, but this important part of his design was relegated to the dangerous hour of a threatening enemy. This work was undertaken too late before the on sweep of the Germans. Instead, Brialmont's single weak detail in surrounding each fort with an infantry platform was tenaciously preserved long after its uselessness must have been apparent. Thus Liege was made a ring fortress to distinguish it from the former latest pattern of earth ramparts and outworks.

Six major and six minor of these forts encircled Liege. From north to south, beginning with those facing the German frontier, their names ran as follows: Barchon, Evegnée, Fleron, Chaudfontaine, Embourg, Boncelles, Flemalle, Hollogne, Loncin, Lantin, Liers, and Pontisse. The armaments of the forts consisted of 6-inch and 4.7-inch guns, with 8-inch mortars and quick firers. They were in the relative number of two, four, two and four for the major forts, and two, two, one and three for the minor *fortins*, as such were termed. The grand total was estimated at 400 pieces. In their confined underground quarters the garrisons, even of the major forts, did not exceed eighty men from the engineer, artillery and infantry branches of the service. Between Fort Pontisse and the Dutch frontier was less than six miles.

It was through this otherwise undefended gap that Von Kluck purposed to advance his German army after the presumed immediate fall of Liege, to that end having seized the Meuse crossing at Visé. The railway line to Aix-la-Chapelle was dominated by Fort Fleron, while the minor Forts Chaudfontaine and Embourg, to the south, commanded the trunk line by way of Liege into Belgium. On the plateau, above Liege, Fort Loncin held

the railway junction of Ans and the lines running from Liege north and west. Finally, the forts were not constructed on a geometric circle, but in such manner that the fire of any two was calculated to hold an enemy at bay should a third between them fall. This was probably an accurate theory before German guns of an unimagined caliber and range were brought into action.

In command of the Belgian forts at Liege was General Leman. He had served under Brialmont, and was pronounced a serious and efficient officer. He was a zealous military student, physically extremely active, and constantly on the watch for any relaxation of discipline. These qualities enabled him to grasp at the outset the weakness of his position.

If the Germans believed the refusal to grant a free passage for their armies through Belgium to be little more than a diplomatic protest, it would seem the Belgian Government was equally mistaken in doubting the Germans would force a way through an international treaty of Belgian neutrality. Consequently, the German crossing of the frontier discovered Belgium with her mobilization but half complete, mainly on a line for the defense of Brussels and Antwerp. It had been estimated by Brialmont that 75,000 men of all arms were necessary for the defense of Liege on a war footing, probably 35,000 was the total force hastily gathered in the emergency to withstand the German assault on the fortifications. It included the Civil Guard.

General Leman realized, therefore, that, without a supporting field army, it would be impossible for him to hold the German hosts before Liege for more than a few days—a week at most.

But he hoped within such time the French or British would march to his relief. Thus his chief concern was for the forts protecting the railway leading from Namur down the Meuse Valley into Liege—the line of a French or British advance.

On the afternoon of August 4, 1914, German patrols appeared on the left bank of the Meuse, approaching from Visé. They were also observed by the sentries on Forts Barchon, Evegnée and Fleron. German infantry and artillery presently came into

view with the unmistakable object of beginning the attack on those forts. The forts fired a few shots by way of a challenge. As evening fell the woods began to echo with the roar of artillery. Later, Forts Fleron, Chaudfontaine and Embourg were added to the German bombardment. The Germans used long range field pieces with powerful explosive shells. The fire proved to be remarkably accurate. As their shells exploded on the cupolas and platforms of the forts, the garrisons in their confined citadels began to experience that inferno of vibrations which subsequently deprived them of the incentive to eat or sleep. The Belgians replied vigorously, but owing to the broken nature of the country, and the forethought with which the Germans took advantage of every form of gun cover, apparently little execution was dealt upon the enemy. However, the Belgians claimed to have silenced two of the German pieces.

In the darkness of this historic night of August 4, 1914, the flames of the fortress guns pierced the immediate night with vivid streaks. Their searchlights swept in broad streams the wooded slopes opposite. The cannonade resounded over Liege, as if with constant peals of thunder. In the city civilians sought the shelter of their cellars, but few of the German shells escaped their range upon the forts to disturb them.

This exchange of artillery went on until near daybreak of August 5, 1914, when infantry fire from the woods to the right of Fort Embourg apprised the defenders that the Germans were advancing to the attack. The Germans came on in their customary massed formation. The prevalent opinion that in German tactics such action was employed to hearten the individual soldier, was denied by their General Staff. In their opinion an advantage was thus gained by the concentration of rifle fire. Belgian infantry withstood the assault, and counter-attacked. When dawn broke, a general engagement was in progress. About eight o'clock the Germans were compelled to withdraw.

The first engagement of the war was won by the Belgians. It was reported that the Belgian fire had swept the Germans down in thousands, but this was denied by German authorities. Up

BEGINNING OF GERMAN INVASION OF BELGIUM

B—Gt. War 2

to this time the German forces before Liege were chiefly Von Kluck's vanguard under Von Emmich, his second line of advance, and detachments of Von Bülow's army. On the Belgian side no attempt was made to follow up the advantage. The reason given is that the Germans were seen to be in strong cavalry force, an arm lost totally in the military complement of Liege. The German losses were undoubtedly severe, especially in front of Fort Barchon. This was one of the major forts, triangular in shape, and surrounded by a ditch and barbed wire entanglements. The armament of these major forts had recently been reenforced, by night secretly, with guns of heavier caliber from Antwerp. As they outmatched the German field pieces of the first attack, presumably the German Intelligence Department had failed in news of them. An armistice requested by the Germans to gather in the wounded and bury the dead was refused. Thereupon the artillery duel recommenced.

A hot and oppressive day disclosed woods rent and scarred, standing wheat fields shell-plowed and trampled, and farm houses set ablaze. The bringing of the Belgian wounded into Liege apprised the citizens that their side had also suffered considerably. Meanwhile, the Germans were reenforced by the Tenth Hanoverian Army Corps, from command of which General von Emmich had been detached to lead Von Kluck's vanguard, also artillery with 8.4-inch howitzers.

The bombardment on this 5th day of August, 1914, now stretched from Visé around the Meuse right bank half circle of forts to embrace Pontisse and Boncelles at its extremities. In a few hours infantry attack began again. The Germans advanced in masses by short rushes, dropping to fire rifle volleys, and then onward with unflinching determination. The forts, wreathed in smoke, blazed shells among them; their machine guns spraying streams of bullets. The Germans were repulsed and compelled to retire, but only to re-form for a fresh assault. Both Belgian and German aeroplanes flew overhead to signal their respective gunners. A Zeppelin was observed, but did not come within range of Belgian fire. The Belgians claim to have shot down one German aeroplane, and another is said to

have been brought to earth by flying within range of its own artillery.

During the morning of August 5, Fort Fleron was put out of action by shell destruction of its cupola-hoisting machinery. This proved a weak point in Brialmont's fortress plan. It was presently discovered that the fire of the supporting forts Evegnée and Chaudfontaine could not command the lines forming the apex of their triangle. Further, since the Belgian infantry was not in sufficient force to hold the lines between the forts, a railway into Liege fell to the enemy. The fighting here was of such a desperate nature, that General Leman hastened to reinforce with all his reserve.

This battle went on during the afternoon and night of August 5, into the morning of August 6, 1914. But the fall of Fort Fleron began to tell in favor of the Germans. Belgian resistance perforce weakened. The ceaseless pounding of the German 8.4-inch howitzers smashed the inner concrete and stone protective armor of the forts, as if of little more avail than cardboard. At intervals on August 6, Forts Chaudfontaine, Evegnée and Barchon fell under the terrific hail of German shells. A way was now opened into the city, though, for the most part, still contested by Belgian infantry. A party of German hussars availed themselves of some unguarded path to make a daring but ineffectual dash to capture General Leman and his staff.

General Leman was consulting with his officers at military headquarters, on August 6, 1914, when they were startled by shouts outside. He rushed forth into a crowd of citizens to encounter eight men in German uniform. General Leman cried for a revolver to defend himself, but another officer, fearing the Germans had entered the city in force, lifted him up over a foundry wall. Both Leman and the officer made their escape by way of an adjacent house. Belgian Civic Guards hastening to the scene dispatched an officer and two men of the German raiders. The rest of the party are said to have been made prisoners.

The end being merely a question of hours, General Leman

ordered the evacuation of the city by the infantry. He wisely decided it could be of more service to the Belgian army at Dyle, than held in a beleaguered and doomed city. Reports indicate that this retreat, though successfully performed, was precipitate. The passage of it was scattered with arms, equipment, and supplies of all kinds. An ambulance train was abandoned, twenty locomotives left in the railway station, and but one bridge destroyed in rear beyond immediate repair. After its accomplishment, General Leman took command of the northern forts, determined to hold them against Von Kluck until the last Belgian gun was silenced.

Early on August 7, 1914, Burgomaster Kleyer and the Bishop of Liege negotiated terms for the surrender of the city. It had suffered but slight damage from the bombardment. Few of the citizens were reported among the killed or injured. On behalf of the Germans it must be said their occupation of Liege was performed in good order, with military discipline excellently maintained. They behaved with consideration toward the inhabitants in establishing their rule in the city, and paid for all supplies requisitioned. They were quartered in various public buildings and institutions, probably to the number of 10,000. The German troops at first seemed to present an interesting spectacle. They were mostly young men, reported as footsore from their long march in new, imperfectly fitting boots, and hungry from the lack of accompanying commissariat. This in proof that the German's military machine did not work to perfection at the outset. Later, some hostile acts by Belgian individuals moved the German military authorities to seize a group of the principal citizens, and warn the inhabitants that the breaking of a peaceful attitude would be at the risk of swiftly serious punishment. Precautions to enforce order were such as is provided in martial law, and carried out with as little hardship as possible to the citizens. The Germans appeared anxious to restore confidence and win a feeling of good will.

For some days after the capitulation of the city the northern forts continued a heroic resistance. So long as these remained uncaptured, General Leman maintained that, strategically,

Liege had not fallen. He thus held in check the armies of Von Kluck and Von Bülow, when every hour was of supreme urgency for their respective onrush into central Belgium and up the Meuse Valley. The Germans presently brought into an overpowering bombardment their 11-inch siege guns.

On August 13, 1914, Embourg was stricken into ruin. On the same day the electric lighting apparatus of Fort Boncelles having been destroyed, the few living men of its garrison fought through the following night in darkness, and in momentary danger of suffocation from gases emitted by the exploding German shells.

Early in the morning of August 14, 1914, though its cupolas were battered in and shells rained upon the interior, the commander refused an offer of surrender. A little later the concrete inner chamber walls fell in. The commander of Boncelles, having exhausted his defensive, hoisted the white flag. He had held out for eleven days in a veritable death-swept inferno.

Fort Loncin disputed with Boncelles the honor of being the last to succumb. The experience of its garrison differed only in terrible details from Boncelles. Its final gun shot was fired by a man with his left hand, since the other had been severed. Apparently a shell exploded in its magazine, and blew up the whole fort. General Leman was discovered amid its debris, pinned beneath a huge beam. He was released by his own men. When taken to a trench, a German officer found that he was merely unconscious from shock.

When sufficiently recovered, General Leman was conducted to General von Heeringen to tender his personal surrender. The two had previously been comrades at maneuvers. The report of their meeting is given by a German officer. The guard presented the customary salute due General Leman's rank. General von Emmich advanced a few steps to meet General Leman. Both generals saluted.

"General," said Von Emmich, "you have gallantly and nobly held your forts."

"I thank you," Leman replied. "Our troops have lived up to their reputation. War is not like maneuvers, *mon Général*," he

added with a pointed smile. "I ask you to bear witness that you found me unconscious."

General Leman unbuckled his sword to offer it to the victor. Von Emmich bowed.

"No, keep it," he gestured. "To have crossed swords with you has been an honor."

Subsequently the President of the French Republic bestowed on Liege the Cross of the Legion of Honor. To its motto in this instance might have been added appropriately: Liege, the Savior of Paris. The few days of its resistance to an overwhelming force enabled the Belgium army to improve its mobilization, the British to throw an expeditionary army into France, and the French to make a new offensive alignment. It will forever remain a brilliant page in war annals. In a military estimate it proved that forts constructed on the latest scientific principles, but unsupported by an intrenched field army, crumple under the concentrated fire of long-range, high-power enemy guns.

The fall of the northern and eastern Liege forts released Von Kluck's army for its march into central Belgium. Meanwhile the Belgian army had been concentrated on a line of the River Dyle, with its left touching Malines and its right resting on Louvain. Its commander, General Selières de Moranville, made his headquarters in the latter city. The Belgian force totaled 110,000 men of all complements. Whether this included the reinforcement by the Liege infantry is uncertain.

During August 10 and 11, 1914, General Moranville threw forward detachments to screen his main body in front of the German advance. On the 11th a rumor that the French had crossed the Sambre, moved General Moranville to extend his right wing to Eghezee, with the hope of getting in touch with the Allies. That the French and British were hastening to his support could not be doubted. They were already overdue, but assuredly would come soon. That was the Belgian reliance, passing from mouth to mouth among the Court, Cabinet Ministers, General Staff, down to the factory toilers, miners, and peasants on their farms. The Sambre report, like many others in various places, proved unfounded.

CHAPTER III

BELGIUM'S DEFIANCE

A VIEW of the general situation in Belgium will assist in clearing the way for swiftly following events. Germany had invaded Belgium against the diplomatic and active protests of its Government. But the German Government still hoped that the heroic resistance of Liege would satisfy Belgian national spirit, and a free passage of German troops now be granted. The German Emperor made a direct appeal to the King of the Belgians through the medium of the Queen of Holland. From the German point of outlook their victory could best be attained by the march through Belgium upon Paris. The German Government asserted that the French and British contemplated a similar breach of Belgian neutrality. To their mind, it was a case of which should be on the ground first. On the other hand, the Allies pronounced the German invasion of Belgium an unprovoked assault, and produced countertestimony. At this time we can venture no further to disentangle it. Probably many years must pass, and mutual passions succeeded by calm investigation, before the clear light of truth can form a correct judgment.

Let us now glance at the condition of Belgium when war was declared. The Belgians were an industrial and not a militant people. They had ample reason to yearn for a permanent peace. Their country had been the cockpit of Europe from the time of Cæsar until Waterloo. The names of their cities, for the most part, represented great historic battle fields. Again and again had the ruin of conflict swept over their unfortunately situated land. At all periods the Belgians were brave fighters on one side or the other, for Belgium had been denied a national unity. Doubtless, therefore, they welcomed the establishment of their independent sovereignty and the era of peace which followed. Historically, they had suffered enough, with an abundance to spare, from perpetual warfare. Their minds turned hopefully toward industrial and commercial activity, stimulated by the

natural mineral wealth of their soil. Thus the products of their factories reached all countries, South America, China, Manchuria, and Central Africa, especially of later years, where a great territory had been acquired in the Congo. The iron and steel work of Liege was famous, Antwerp had become one of the chief ports of Europe and growing into a financial power. But owing to the confined boundaries of Belgium, there grew to be a congestion of population. This produced a strong democratic and socialistic uplift which even threatened the existence of the monarchy. Also, all that monarchy seemed to imply.

The Belgians, doubtless with memories of the past, despised and hated the display of military. Consequently it was only with difficulty, and in the face of popular opposition, that the Belgium Government had succeeded with military plans for defense, but imperfectly carried out. Herein, perhaps, we have the keynote to Belgium's desperate resistance to the German invaders. In the light of the foregoing, it is easily conceivable that the Germans represented to the Belgians the military yoke. They were determined to have none of it, upon any overtures or terms. But they relied on France and England for protection, when common prudence should have made the mobilization of an up-to-date army of 500,000 men ready for the call to repel an invader on either of the frontiers, instead of the practically helpless force of 110,000.

The German General Staff did not believe the Belgians intended to raise a serious barrier in their path. But with the crisis, democratic Belgium united in a rush to arms, which recalls similar action by the American colonists at the Revolution. Every form of weapon was grasped, from old muskets to pitchforks and shearing knives. It was remarked by a foreign witness that in default of properly equipped armories, the Belgians emptied the museums to confront the Germans with the strangest assortment of antiquated military tools.

As testimony of Belgian feeling, the Labor party organ "Le Peuple" issued the following trumpet blast: "Why do we, as irreconcilable antimilitarists, cry 'Bravo!' from the bottom of our hearts to all those who offer themselves for the defense of the

country? Because it is not only necessary to protect the hearths and homes, the women and the children, but it is also necessary to protect at the price of our blood the heritage of our ancient freedom. Go, then, sons of the workers, and register your names as recruits. We will rather die for the idea of progress and solidarity of humanity than live under a régime whose brutal force and savage violence have wiped outright."

The Belgian General Staff, foreseeing dire consequences from such inflaming press utterances, warned all those not regularly enlisted to maintain a peaceful attitude. How far this action was unsuccessful unfortunate events disclosed.

On Wednesday, August 12, 1914, a German cavalry screen, thrown in advance of the main forces, came in touch with Belgian patrols. A series of engagements took place. The Germans tried to seize the bridges across the Dyle at Haelen, and at Cortenachen on the Velpe, a tributary of the former river, mainly with the object of outflanking the Belgian left wing. The Belgians are said to have numbered some 10,000 of all arms, and were successful in repulsing the Germans.

On August 13, 1914, similar actions were continued. At Tirlemont 2,000 German cavalry swept upon the town, but were beaten off. At Eghezee on the extreme Belgian right—close to Namur and the historic field of Ramillies—another brush with the Germans took place. Belgian cavalry caught a German cavalry detachment bivouacked in the village. Sharp fighting through the streets ensued before the Germans withdrew. In spite of the warning of the Belgian General Staff, and similar advance German notices, the citizens of some of these and other places began sniping German patrols.

Meantime, moving over the roads toward Namur, toiled the huge German 42-centimeter guns. The German General Staff had taken to mind the lesson of Liege. Each gun was transported in three parts, hauled by thirteen traction engines and forty horses. Of this, with the advance of Von Kluck and Von Bülow, the Belgian General Staff was kept in total ignorance by the German screen of cavalry. So ably was this screen work performed that the Belgians were led to believe the Germans had

succeeded in placing no more than two divisions of cavalry, together with a few detachments of infantry and artillery, on Belgian soil. They, in fact, regarded the German cavalry skirmishing as a rather clumsy offensive.

As we have seen, the resistance of Forts Boncelles and Loncin at Liege held back the main German advance from seven to ten days. Their fall released into German control the railway junction at Ans. With that was included the line from Liege up the left bank of the Meuse to Namur. Also, another line direct to Brussels.

On August 15, 1914, the cavalry screen was withdrawn, and four German army corps were revealed to the surprised Belgian line. In this emergency, clearly their only hope lay with the French. In Louvain, Brussels, and Antwerp, anxious questions lay on all lips. "Why do not the French hasten to our aid? When will they come? Will the British fail us at the twelfth hour?"

Eager watchers at Ostend beheld no sign of the promised transports to disembark a British army of support in the day of overwhelming need. About this time some French cavalry crossed the Sambre to join hands with the Belgian right wing near Waterloo. But it was little more than a detachment. The French General Staff was occupied with a realignment, and had decided not to advance into Belgium until they could do so in force sufficient to cope with the Germans. The Belgian General Staff saw there was no other course but to fall back, fighting rear-guard actions until the longed-for French army was heralded by the thunder of friendly guns.

The Belgian army was thus withdrawn from the River Gethe to hold Aerschot on its left stubbornly through August 14, 1914. Diest, St. Trond, and Waremmme fell before the German tidal wave without resistance. Von Kluck's main army endeavored to sweep around the Belgian right at Wavre, but was checked for a brief space.

CHAPTER IV

CAPTURE OF LOUVAIN—SURRENDER OF
BRUSSELS

DURING August 17, 1914, the German center was hurled forward in irresistible strength. The citizens of the villages in its path fled precipitously along the roads to Brussels. At intersections all kinds of vehicles bearing household effects, together with live stock, blocked the way to safety. The uhlan had become a terror, but not without some provocation. Tirlemont was bombarded, reduced, and evacuated by the Belgian troops. The latter made a vigorous defensive immediately before Louvain, but their weakness in artillery and numbers could not withstand the overwhelming superiority of the Germans. They were thrust back from the valley of the Dyle to begin their retreat on Antwerp, chiefly by way of Malines. This was to elude a successful German envelopment on their Louvain right. They retired in good order, but their losses had been considerable.

This body was the Belgian right wing, which fell back to take up a position before Louvain. Here it fought a well-sustained action on August 19, 1914, the purpose of which was to cover the retreat of the main army by way of Malines on Antwerp. The Belgian right wing thus became a rear guard.

It withstood the German attack until the early morning of August 20, 1914, when, separated from the main body, the overpowering number of German guns and men drove it back to a final stand between Louvain and Brussels. If its losses had been heavy, the carrying away of the wounded proved that it still maintained a fighting front. The retreat of the main army on Antwerp was part of the strategy of Brialmont, since the position of Brussels was not capable of a strong defense. By this time the main army was safely passing down the valley of the Dyle to the shelter of the Antwerp forts, leaving the right wing to its fate. Louvain thus fell to the Germans.

Toward noon of August 20, 1914, the burgomaster and four

sheriffs awaited at one of the city gates, the first German appearance. This proved to be a party of hussars bearing a white flag. They conducted the burgomaster to the waiting generals at the head of the advance column. In token of surrender the burgomaster was requested to remove his scarf of office, displaying the Belgian national colors. The German terms were then pronounced. A free passage of troops through the city was to be granted, and 3,000 men garrisoned in its barracks. In return, cash was to be paid for all supplies requisitioned, and a guarantee given for the lives and property of the inhabitants. The Germans further agreed to maintain the established civil power, but warned that hostile acts by civilians would be severely punished. These terms were in general in conformity with the rules of war governing the military occupation of an enemy city. In this respect emphasis should be laid on the fact that under these rules the hostile act of any civilian places him in the same position as a spy. His recognized sentence is death by court-martial.

The Germans entered Louvain with bands playing, and singing in a great swelling chorus: "Die Wacht am Rhine" and "Hail to the War Lord." They marched to quick time, but in passing through the great square of the Gare du Nord broke into the parade goose step. In the van were such famous regiments as the Death's Head and Zeiten Hussars. The infantry wore heavy boots, which, falling in unison, struck the earth with resounding blows, to echo back from the house walls. Thus cavalry, infantry, and artillery poured through Louvain in a gray-green surge of hitherto unimagined military might. This, for the latter part of the 20th and the day following.

At first the citizens looked on from the sidewalks in a spell-bound silence. Scarcely one seemed to possess the incentive to breathe a whisper. Only the babies and very small children regarded the awe-inspiring spectacle as something provided by way of entertainment. For the rest of the citizens it was dumbfounding beyond human comprehension. Cavalry, infantry, and artillery rolled on unceasingly to the clatter of horses' hoofs, the tramp of feet, the rumble of guns, and that triumphant mighty chorus. There was nothing of aforetime plumed and gold-

LOUVAIN'S CAPTURE—BRUSSELS'S SURRENDER 29

laced splendor of war about it, but the modern Teutonic arms on grim business bent. Except for a curious glance bestowed here and there, the German troops marched with eyes front, and a precision as if being reviewed by the emperor. A few shots were heard to stir instant terror among the citizen onlookers, but these were between the German advance guard and Belgian stragglers left behind in the city. Presently the side streets became dangerous to pedestrians from onrushing automobiles containing staff officers, and motor wagons of the military train. General von Arnim, in command, ordered the hauling down of all allied colors, but permitted the Belgian flag to remain flying above the Hôtel de Ville. He promptly issued a proclamation warning all citizens to preserve the peace. It was both placarded and announced verbally. The latter was performed by a minor city official, ringing a bell as he passed through the streets accompanied by policemen.

Toward evening of August 20, 1914, the cafés and restaurants filled up with hungry German officers and men; every hotel room was occupied, and provision shops speedily sold out the stores on their shelves. The Germans paid in cash for everything ordered, and preserved a careful attitude of nonaggression toward the citizens. But subconsciously there ran an undercurrent of dread insecurity. At the outset a German officer was said to have been struck by a sniper's bullet. Somewhat conspicuously the wounded officer was borne on a litter through the streets, followed by the dead body of his assailant. Very promptly a news curtain was drawn down around the city, cutting it off from all information of the world without. Artillery fire was heard. Presumably this came from the last stand of the Belgian rear guard in a valley of the hilly country between Louvain and Brussels. With sustained optimism to the end, rumor had it that the artillery fire was that of French and British guns coming to the relief of Louvain. Toward nightfall one or two groups of snipers were brought in from the suburbs and marched to the place of execution.

The feeling of a threatened calamity deepened. Another warning proclamation was issued ordering all citizens to give up their

arms. Further, everyone was ordered to bed at eight o'clock, all windows were to be closed and all doors unlocked. A burning lamp was to be placed in each window. On the claim that German soldiers had been killed by citizens, the burgomaster and several of the city officials were secured as hostages. A stern proclamation was issued threatening with immediate execution every citizen found with a weapon in his possession or house. Every house from which a shot was fired would be burned.

This was on August 22, 1914. By the evening of that day the German army had passed through Louvain, estimated to the number of 50,000 men. Only the 3,000 garrison remained in the city. Outwardly, the citizens resumed their usual daily affairs as if with a sense of relief, but whispers dropped now and then revealed an abiding terror beneath. Some time during the next day or two the anticipated calamity fell upon Louvain. The German officers insisted that sniping was steadily going on, and the military authorities put into force their threatened reprisal. The torch, or rather incendiary tablets were thrown into convicted houses. Larger groups of citizens were led to execution. Thereupon the "brute" passion dormant in soldiers broke the bonds of discipline. Flames burst forth everywhere. Beneath the lurid glow cast upon the sky above Louvain whole streets stood out in blackened ruin, and those architectural treasures of the Halles and the University, with its famous library, were destroyed beyond hope of repair. Only the walls of St. Peter's Church, containing many priceless paintings, remained.

Meanwhile, on the morning of August 20, 1914, the German army had swept away the comparatively small Belgian rear-guard force before Brussels, and advanced upon the capital. On the previous 17th the King of the Belgians removed his Government to Antwerp. The diplomatic corps followed. Mr. Brand Whitlock, the American Minister, however, remained. In his capacity as a neutral he had assisted stranded Germans in Brussels from hasty official and mob peril. He stayed to perform a similar service for the Belgians and Allies. His success in these efforts won for him German respect and the gratitude of the whole Belgian nation.

LOUVAIN'S CAPTURE—BRUSSELS'S SURRENDER 31

A lingering plan for defending Brussels by throwing up barricades and constructing wire entanglements, to be manned by the Civic Guard, was abandoned in the face of wiser counsel. It would merely have resulted in a bombardment, with needless destruction of life and property. Brussels was defenseless.

In flight before the German host, refugees of all classes were streaming into Brussels—young and old, rich and poor, priest and layman. Nearly all bore some burden of household treasure, many some pathetically absurd family heirloom. Every kind of vehicle appeared to have been called into use, from smart carriages drawn by heavy Flemish horses to little carts harnessed to dogs. Over all reigned a stupefied silence, broken only by shuffling footfalls. Among them the absence of automobiles and light horses would indicate all such had been commandeered by the Belgian military authorities. Their cavalry was badly in need of good light-weight mounts. At crossroads passage to imagined safety was blocked by farm live stock driven by bewildered peasants.

On Thursday morning, August 20, 1914, the burgomaster motored forth to meet the Germans. His reception and the terms dictated by General von Arnim were almost identically the same as at Louvain. The burgomaster was perforce compelled to accept. The scene of the entry of the German troops into Louvain was repeated at Brussels. There was the same stolidly silent-packed gathering of onlookers on the sidewalks, the same thundering triumphant march of the German host. Corps after corps, probably of those who had fought at Liege, and subsequently passed around the city on the grand sweep toward the French frontier. Moreover, huge bodies of German troops were advancing up the valley of the Meuse and through the woods of the Ardennes. As in Louvain, that night the hotels, restaurants, cafés, and shops of Brussels were patronized by a rush of trade which never before totaled such extent in a single day. Bills of purchase were settled by the Germans in cash. The city was promptly assessed a war indemnity of \$40,000,000.

With the fall of Brussels, the first objective of the Germans

may be said to have been gained. But the right wing of Von Kluck's army was still operating northward upon Antwerp. The Belgian army had escaped him within the circle of Antwerp's forts, so that he detailed a force deemed to be sufficient to hold the enemy secure. Then he struck eastward between Antwerp and Brussels at Alost, Ghent, and Bruges. In his advance he swept several divisions of cavalry, also motor cars bearing machine guns. Beyond Bruges his patrol caught their first glimpse of the North Sea, drawing in toward another much-hoped-for goal on the English Channel.

But the Belgian army within security of Antwerp had not been routed. It had retreated in good order, thanks to the resistance of its right-wing rear guard. General de Moranville promptly reenforced it with new volunteers to the extent of some 125,000 men. In addition, he drew upon a fresh supply of ammunition, and new artillery well horsed. His cavalry, however, were certainly no better and probably worse than that with which his army had been complemented originally.

On August 23, 1914, obtaining information that the Germans were in considerably inferior force at Malines, the Belgians began a vigorous counteroffensive. General de Moranville drove the Germans out of Malines on the day following. That was in the nature of a master stroke, for it gave the Belgians control of the shortest railway from Germany into West Flanders. Further, since Von Kluck had reached Bruges, and reenforcements under General von Boehn had passed across the Belgian direct line on Brussels, the great German right wing was in danger of being caught in a trap. Von Boehn, therefore, was hurriedly detached rearward to deal with the Belgian counteroffensive. But this deprived Von Kluck of his needed reenforcements to overcome 2,000 British marines landed at Ostend, that, together with the Civic Guard, had beaten back German patrols from the place. Had the British now landed an army at Ostend, Von Kluck, between the Belgian and British forces, would have been in serious danger of annihilation. With the German right wing thus crumpled, the whole of their offensive would have broken down. But the British did not come, and so the Belgians

were left to fight it out single handed. This fighting went on for three weeks, with accurate details lacking. Mainly it was upon the line Aershot-Dyle Valley-Termonde, with Antwerp for the Belgian base.

On August 24, 1914, a German Zeppelin sailed over Antwerp and dropped a number of bombs. The Belgians thrust their right wing forward and recaptured Alost. They advanced their center to a siege of Cortenburg. Malines seemed secure. To the Belgians this was a historic triumph. Famous for its manufacture of lace under the name of Mechlin, almost every street contained some relic of architectural interest. The Cathedral of St. Rombaut, the seat of a cardinal archbishop, held upon its walls some of Van Dyck's masterpieces. Margaret of Austria had held court in its Palais de Justice.

In this emergency, Von Boehn was heavily reenforced with the Third Army Corps, reserves from the south, and 15,000 sailors and marines. His army was now between 250,000 and 300,000 men. This placed overwhelming odds against the Belgians. But for four days they fought a stubborn battle at Weerde.

This was from September 13 to 16, 1914, and resulted in the capture of the Louvain-Malines railway by the Germans. The Belgians had now fought to the extremity of what could be expected without aid from the Allies. The sole action left for them was to fall back for a defense of Antwerp. Von Kluck's right wing of the whole German offensive had completed its task on Belgian soil.

CHAPTER V

COMING OF THE BRITISH

WE now come to the arrival of the British on the Continent. In using the term British, it is expressly intended to comprise the united forces of the British Isles.

On August 3, 1914, the British Government practically gave up hope that war with Germany could be avoided, though it would

appear to have lingered until the ultimatum to Germany to vacate Belgian soil remained unanswered. On that day the army was mobilized at Aldershot.

On August 5, 1914, Lord Kitchener was recalled at the outset from a journey to Egypt, and appointed Minister of War. No more fortunate selection than this could have been made. Above all else, Lord Kitchener's reputation had been won as an able transport officer. In the emergency, as Minister of War, the responsibility for the transport of a British army overseas rested in his hands. On August 5, 1914, the House of Commons voted a credit of \$100,000,000, and an increase of 500,000 men to the regular forces. Upon the same day preparations went forward for the dispatch of an expeditionary army to France.

The decision to send the army to France, instead of direct to a landing in Belgium, would seem to have been in response to an urgent French entreaty that Great Britain mark visibly on French soil her unity with that nation at the supreme crisis. For some days previously British reluctance to enter the war while a gleam of hope remained to confine, if not prevent the European conflagration, had created a feeling of disappointment in France.

The British Expeditionary Army was formed in four divisions. The average British division comprised 12,000 infantry, a regiment of cavalry, and 76 guns, with complements of engineers and signal corps. Also medical, commissariat, and transport services. But with the Expeditionary Army all complements were considerably augmented. Thus were five brigades, or fifteen regiments of cavalry. The total appears to have been between 150,000 and 160,000 men. The whole was placed under the command of Field Marshal Sir John French, with Lieutenant General Sir Archibald Murray, Chief of Staff. Field Marshal French's record in the Boer War and elsewhere had proved him to be an efficient cavalry leader. He occupied in succession the positions of commander of the First Army Corps at Aldershot, Inspector General of the Forces, and Chief of the Imperial General Staff. But he had never commanded an army in the field, and was unfamiliar with the handling of the huge armies of the European Continent. We may here note, in passing, that with the single

exception of Field Marshal von Mackensen, no cavalry general in modern times has successfully commanded a whole army. He was sixty-two and was two years younger than Lord Kitchener. His responsibilities were great, his capabilities for the developing scope of the task untried, but as a serious and courageous officer he fully merited the honors he had already won.

By August 7, 1914, Admiral Jellicoe was able to guarantee a safe passage for the British army across the English Channel. A fortunate mobilization of the British Grand Fleet in the North Sea for maneuvers shut off the German Grand Fleet from raiding the Channel. There was nothing to criticize in the manner in which the Expeditionary Army was thrown into France. Its equipment was ready and in all details fully worthy of German military organization. From arms to boots—the latter not long since a scandal of shoddy workmanship—only the best material and skill had been accepted. Its transport proved the genius of Lord Kitchener in that brand of military service. The railways leading to the ports of embarkation, together with passenger steamships—some of them familiar in American ports—were commandeered as early as the 4th of August.

During the night of August 7, 1914, train after train filled with troops steamed toward Southampton, and some other south-coast ports. Complements were also embarked at Dublin, Avonmouth, and the Bristol Channel. In the middle of the night citizens of small towns along the route were awakened by the unceasing rumble of trains. They had no conception of its import. They did not even realize that war had actually burst upon the serenity of their peaceful lives. Each transport vessel was placed in command of a naval officer, and guarded in its passage across the channel by light cruisers and torpedo destroyers. The transport of the whole Expeditionary Army was completed within ten days, without the loss of a man and with a precision worthy of all military commendation. But such secrecy was maintained that the British public remained in ignorance of its passage until successfully accomplished. American correspondents, however, were not yet strictly censored, so that their papers published news of it on August 9.

On Sunday, August 9, 1914, two British transports were observed making for the harbor of Boulogne. The weather was all that could be wished, the crossing resembled a bank-holiday excursion. For some days previously the French had taken a gloomy view of British support. But French fishermen returning from Scotland and English ports maintained confidence, for had not British fishermen told them the French would never be abandoned to fall a prey to the enemy.

When the two advance British transports steamed into view, "Les Anglais," at last everyone cried. At once a hugely joyful reversion of feeling. The landing of the British soldiers was made a popular ovation. Their appearance, soldierly bearing, their gentleness toward women and children, their care of the horses were showered with heartfelt French compliments. Especially the Scotch Highlanders, after their cautious fashion, wondered at the exuberance of their welcome. For the brave Irish, was not Marshal MacMahon of near-Irish descent and the first president of the Third Republic? The Irish alone would save that republic. Women begged for the regimental badges to pin on their breasts. In turn they offered delicacies of all kinds to the soldiers. For the first time in a hundred years the British uniform was seen on French soil. Then it represented an enemy, now a comrade in arms. The bond of union was sealed at a midnight military mass, celebrated by English-speaking priests, for British and French Catholic soldiers at Camp Malbrouck round the Colonne de la Grande Armée. The two names recalled the greatest of British and French victories—Blenheim, Ramillies, and Oudenarde, Ulm, Austerlitz, and Jena.

Meanwhile, officers of the French General Staff had journeyed to London to confer with the British General Staff regarding the camping and alignment of the British troops. Meanwhile, also, the British reserves and territorials were called to the colors. The latter comprised the militia, infantry and artillery, and the volunteer yeomanry cavalry, infantry and artillery. The militia was the oldest British military force, officered to a great extent by retired regular army men, its permanent staffs of noncommissioned officers were from the regular army, and it was under

the direct control of the Secretary of State for War. The volunteer infantry, artillery, and yeomanry cavalry were on a somewhat different basis, more nearly resembling the American militia, but with the British militia, were linked with regular-line battalions. The reserves, militia and volunteers, added approximately 350,000 well-trained men for immediate home defense.

On Sunday, August 17, 1914, it was officially announced that the whole of the British Expeditionary Army had landed in France. Conferences between the British and French General Staffs resulted in the British army being concentrated first at Amiens. From that point it was to advance into position as the left wing of the united French and British armies, though controlled by their separate commanders.

The French Fifth Army had already moved to hold the line of the River Sambre, with its right in touch with Namur. Cavalry patrols had been thrown forward to Ligny and Gembloux, where they skirmished with uhlans. Charleroi was made French headquarters. It was the center of extensive coal-mining and steel industry. Pit shafts and blast furnaces dominated the landscape. Historically it was the ground over which Blücher's Fourth Army Corps marched to the support of the British at Waterloo. Now the British were supporting the French upon it against their former ally.

On Thursday, August 20, 1914, the British took up their position on the French left. Their line ran from Binche to Mons, then within the French frontier stretched westward to Condé. From Mons to Condé it followed the line of the canal, thus occupying an already constructed barrier. Formerly Condé was regarded as a fortress of formidable strength, but its position was not held to be of value in modern strategy. Its forts, therefore, had been dismantled of guns, and its works permitted to fall into disuse. But the fortress of Maubeuge lay immediately in rear of the British line. In rear again General Sordet held a French cavalry corps for flank actions. In front, across the Belgian frontier, General d'Amade lay with a French brigade at Tournai as an outpost.

Before proceeding to British headquarters, General French held a conference with General Joffre, Commander in Chief of all the French armies. Until the outbreak of the war, General Joffre was practically unknown to the French people. He was no popular military idol, no boulevard dashing figure. But he had seen active service with credit, and had climbed, step by step, with persevering study of military science into the council of the French General Staff. As a strategist his qualities came to be recognized as paramount in that body. A few years previously he had been intrusted with the reorganization of the French army, and his plans accepted. Therefore, when war with Germany became a certainty, it was natural the supreme command of the French army should fall to General Joffre.

CHAPTER VI

CAMPAIGNS IN ALSACE AND LORRAINE

THE French staff apparently had designed a campaign in Upper Alsace and the Vosges, but the throwing of a brigade from Belfort across the frontier on the extreme right of their line on August 6 would seem to have been undertaken chiefly with a view of rousing patriotic enthusiasm. French aeroplane scouts had brought in the intelligence that only small bodies of German troops occupied the left bank of the Rhine. Therefore the opportunity was presented to invade the upper part of the lost province of Alsace—a dramatic blow calculated to arouse the French patriotic spirit. Since the Germans had expended hardly any effort in its defense, leaving, as it were an open door, it may have been part of the strategy of their General Staff to draw a French army into that region, with the design of inflicting a crushing defeat. Thus French resistance in the southern Vosges would have been weakened, the capture of Belfort, unsupported by its field army, a probability, and a drive beyond into France by the German forces concentrated at Neubreisach made trium-

phant. Doubtless the French General Staff fully grasped these tactics, but considered a nibble at the alluring German bait of some value for its sentimental effect upon the French and Alsations. Otherwise the invasion of Upper Alsace with a brigade was doomed at the outset to win no military advantage.

On August 7, 1914, the French dispersed a German outpost intrenched before Altkirch. Some cavalry skirmishing followed, which resulted in the French gaining possession of the city. As was to be expected, the citizens of Altkirch welcomed the French with enthusiasm. The following morning the French were permitted an uncontested advance to Mülhausen. That such an important manufacturing center as Mülhausen should have remained unfortified within striking distance of the French frontier, that the French entered it without being compelled to fire a shot, was a surprise to every one with the probable exception of the German and French General Staffs.

The citizens of Mülhausen repeated the joyous ovation bestowed on the French troops in Altkirch. The French uniform was hailed as the visible sign of deliverance from German dominion, and the restoration of the lost province to their kindred of the neighboring republic. The climax of this ebullition was reached in a proclamation issued by direction of General Joffre. "People of Alsace," it ran, "after forty years of weary waiting, French soldiers again tread the soil of your native country. They are the pioneers in the great work of redemption. What emotion and what pride for them! To complete the work they are ready to sacrifice their lives. The French nation with one heart spurs them forward, and on the folds of their flag are inscribed the magical names Liberty and Right. Long live France! Long live Alsace!"

During August 8, 1914, some intermittent fighting went on in the vicinity of Mülhausen, which seems to have given the French general in command the impression that the Germans were not eager for a counterattack. In turn the Germans may well have been puzzled that a French brigade instead of an army was thrown into Upper Alsace for the bait of Mülhausen. Possibly they waited a little for the main body, which did not come.

Sunday, August 8, 1914, revealed the Germans in such over-

powering strength, that the French were left no other choice than to beat a hasty retreat. They accordingly fell back upon Altkirch, to intrench a few miles beyond their own border. Thus ended the French initial offensive. In military reckoning it achieved little of value.

The French plan of campaign was dominated by another motive than pure strategy. From the Franco-Prussian War of 1870 came the patriotic heritage of a redemption of the lost provinces of Alsace and Lorraine. Whatever the confusion of French politics was otherwise, no party dared to set aside the attainment of this hope in every French breast. The statue of Strassburg, the capital of Lorraine, in the Place de la Concorde at Paris, was every year the object of a mourning demonstration. Its draped figure and crêpe-tied wreaths proclaimed to the Germans, and everyone else, what France demanded of her statesmen. Consequently the French General Staff had ever before them that order of the day from the French people. It was never permitted to be absent from their minds. The French General Staff, therefore, made their plan to recapture the lost French territory up to the left bank of the Rhine as their main offensive at the opening of hostilities with the Germans.

It was not "On to Berlin" as in 1870, but Alsace and Lorraine was glowingly written upon the face of every French reservist when he marched silently but with a supreme hope to "somewhere at the front." To him there was but a single front—the German frontier line running along the ridge of the Vosges Mountains from the Swiss border to the Ardennes, separating France from Alsace and Lorraine.

The Germans knew that Belfort with its field army was impregnable. So long as the French maintained that situation at Belfort, a German drive by that road into France was impossible. While the Germans had left their back door open at Altkirch, they were in great strength all along the right bank of the Rhine, stretching from Neubreisach southward by way of Colmar to Strassburg.

The plan of the French General Staff, therefore, was to mass her armies along the line of the Vosges, protected on the right

and left flanks by the great fortresses of Belfort and Longwy, for a grand and patriotically inspiring drive on Metz, Strassburg, and Colmar. Doubtless every mile of the way, every hour of the time, was calculated to a fraction. Granted, the Germans did occupy Luxemburg and threaten Longwy on their left, or invade Belgium, so long as Liege and Namur held out the Germans would hardly dare to venture far beyond those fortresses. Brialmont was recognized as a great military engineer, the successor of Vauban. Up till the outbreak of war there was not much reason to doubt the resisting strength of his work. In fact we have seen how two or three of his forts at Liege held Von Kluck in check for days. Had the whole ring of his forts been supported by a field army the armies of Von Kluck and Von Bülow would have been halted almost indefinitely, and those of the Duke of Württemberg and the crown prince compelled to mark time in the Ardennes. That would have provided the French with ample leeway to accomplish some brilliant feat like the capture of Strassburg, and for a space beyond the commencement of war, at any rate, end any danger of a German invasion by way of Luxemburg and Belgium. This is reasoning from the view of the French General Staff, who, in their plan, reckoned on the strength of Liege and Namur to protect their northern frontier from a German attack through Belgium.

Whatever the motive of the French General Staff in the preliminary campaign in Alsace, the campaign in the Vosges, beginning August 10, was undertaken in grim earnest.

Before proceeding to an account of this French offensive of the Vosges, which commenced with a seizure of the passes, occupying from August 10 to August 15, 1914, we might appropriately glance at the field of operations in the Ardennes on the French left. Here, during the above period, something in the nature of a victory was granted to the French arms—an inspiration to greater things in Alsace-Lorraine.

On August 13, 1914, the German Crown Prince, commanding the Fourth Army, advanced from Luxemburg into the southern Ardennes and captured Neufchâteau. His further objective was to break through the French line somewhere near the historic

ground of Sedan. But at this point some change in the German plan seems to have taken place. From the maze still enveloping the opening events of the war, one can only conjecture a reason which would move such an irrevocable body as the German General Staff to alter a long-fixed plan. Probably, then, the unanticipated strength of Belgian resistance foreshadowed the summoning of reenforcements to Von Kluck's right wing of the whole German army. We have seen, in fact, how he came to be near a desperate need at Bruges, and only the heavy reenforcement of Von Boehn enabled that general to deliver a final defeat of the Belgian field army at Weerde. Whatever the cause of change of plan may have been, important forces attached to or intended for the armies of the Duke of Württemberg and the crown prince were withdrawn to support the armies of Von Kluck and Von Bülow. These forces went to form a unit under General von Husen, a veteran of Sadowa. This change left the Saxon army of the crown prince with hardly sufficient strength for a main attack on the French line at Sedan, but still formidable enough to feel its way cautiously through the Ardennes to test the French concentration on the central Meuse west bank. When the German right had finally settled Liege, the Saxon army could then join in the united great movement on Paris.

Early on the morning of August 15, 1914, a French detachment of half an infantry regiment, thrown into Dinant, was surprised by a mobile Saxon advance force of cavalry, infantry and artillery. Dinant lies across the Meuse eighteen miles south of Namur. It is a picturesque ancient town, the haunt of artists and tourists. In the vicinity are the estates of several wealthy Belgian families, particularly the thirteenth-century château of Walzin, once the stronghold of the Comptes d'Ardennes. A bridge crosses the Meuse at Dinant, which sits mainly on the east bank within shadow of precipitous limestone cliffs. A stone fort more imposing in appearance than modern effectiveness crowns the highest cliff summit overlooking Dinant. The Germans came by way of the east bank to occupy the suburbs. They presently captured the fort and hoisted the German flag. Meanwhile the French took possession of the bridge, being at

a considerable disadvantage from German rifle fire from the cliffs. The solid stone abutments of the bridge, however, enabled the French to hold that position until strong reinforcements arrived early in the afternoon. While French infantry cleared the environs of Germans, their artillery bombarded the fort from the west bank. Their shells played havoc with the old fort defenses, soon compelling its evacuation by the Germans. One of the first French artillery shells blew into shreds the German flag flying triumphantly over the fort, thus depriving the French of the satisfaction of hauling it down. Toward evening the Germans retreated toward the Lesse, followed by the French. In previous wars the forces engaged were of sufficient strength to designate Dinant a battle, but with the vast armies of the present conflict it sinks to the military grade of a mere affair. However, it is called by the French the Battle of Dinant.

We now return to the French great Vosges offensive. A little before August 10, 1914, French airmen had brought in reports that the German Sixth Army under General von Heeringen, with headquarters at Metz, was weak to the extent of being unable to hold that part of Lorraine between the Rhine and Vosges. These airmen had evidently not observed what their brother of the clouds had seen previously in his flight from Belfort—that the Germans were in great strength on the right bank of the Rhine. General von Heeringen was regarded by the German General Staff as among the ablest of their strategists.

General de Castelnau and Pau commanded the French armies of Lorraine and Alsace respectively. They promptly threw forward forces to occupy the passes of the Vosges Mountains.

Thus for five days, from August 10 to 15, 1914, the familiar but too conspicuous blue-coated and red-trousered French uniforms advanced up the stream-watered ravines on the west slope, while their artillery climbed to the elevated plateaus. On the German side the descent is more abrupt to the Alsatian plain. From summit spurs distant views can be obtained of spired cities and prosperous townships. In the upland Vosges valleys nestle villages of thrifty peasants, sheltered by leafy woodlands. The Germans had placed weak outposts on their side of the

frontier which the French swept back with little difficulty. Some harder fighting took place in winning the Col de Bonhomme and the Col de Sainte Marie. From Saint Dié they advanced to seize the important pass of Salles. In this they were successful after sweeping it with artillery fire from the commanding plateau of Blaques. A direct route to Strassburg now lay open by the way of the Bruche Valley.

On August 11, 1914, the Germans moved to counter these operations. It may have been that they were merely maneuvering for position. The French advancing from Montmedy drove back the crown prince's vanguard from before Spincourt. Also, General de Castelnau's left wing compelled another German force, moving south from Blamont, to retreat to its base at Metz. Similarly the French again marched through the open German back door at Altkirch to a succession of minor victories. They captured Dannemaire and Thann to thrust the Germans back upon the Swiss frontier.

On August 17, 1914, Saarburg, on the railway between Strassburg and Metz, fell to the French. Mülhausen was reoccupied, together with twenty-four guns and prisoners. Colmar appeared to be within the French grasp.

By August 19, 1914, the French field commanders seemed to possess every reason to send triumphant bulletins to Paris, to rouse wild enthusiasm among the citizens. London applauded. Allied partisans everywhere echoed the cry "Vive la France," and prophesied that the French flag would presently be carried across the Rhine, not without display of reason. The French were in possession of nearly the whole of Upper Alsace, they could almost touch the Rhine, and the Lorraine army's left wing had occupied a conspicuous advantage between Saarburg and Château Salins, threatening Metz. The joy in Paris was reflected in Alsace. The citizens welcomed the renaming of their towns and the establishment of French civil government. But it was all too easily accomplished—considering the heavy bodies of troops on the right bank of the Rhine observed by the first French airscout from Belfort.

Doubtless sometime during August 20-21, 1914, these reserves

were unostentatiously thrown across to the left bank to reenforce General von Heeringen on a prepared plan. Presently a German army in full force moved from Metz and struck at the French left. It advanced with its right wing touching Pont-à-Mousson, its center on the line Salins-Deuse, and its left resting on the railway beyond Luneville in the direction of Saarburg. A force was detached from this latter wing which promptly drove the French out of Saarburg. The German main counter-attack was delivered on the 21st. The whole French left wing was driven back, crumpled and routed. The French were taken by surprise at this sudden and unexpected appearance of the German army in overwhelming numbers. Confusion among the corps commanders added to their desperate situation. The Germans captured thousands of prisoners, whole batteries of artillery, together with quantities of commissariat and transport. The French left was thus flung in retreat behind the River Meurthe, relinquishing the Vosges northern passes to the Germans.

On August 22, 1914, the Germans drove the French out of Luneville and hurled them back on Nancy. Similarly the German center forced the French center to retreat across the Vosges to a new line running from Mülhausen to Nancy. General Pau still held Mülhausen and a part of Upper Alsace, together with the extremity of the Lower Vosges, but it was doubtful how soon he might not be compelled to fall back on Belfort. Thus ended the French great offensive of the Vosges.

CHAPTER VII

SIEGE AND FALL OF NAMUR

WHEN the Germans occupied Brussels on August 20, 1914, we observed that corps after corps did not enter the city, but swept to the south. This was Von Kluck's left wing moving to attack the Allies on the Sambre-Mons front. The forces which

passed through Brussels were Von Kluck's center, advancing south by east to fall in line beside the right wing, which had mainly passed between Brussels and Antwerp to the capture of Bruges and Ghent. The whole line when re-formed on the French frontier would stretch from Mons to the English Channel—the great right wing of the German armies.

Meanwhile, Von Bülow's second army had advanced up the valley of the Meuse, with its right sweeping the Hisbaye uplands. Some part of this army may have been transported by rail from Montmedy. Its general advance in columns was directed chiefly upon the Sambre crossings. As Von Kluck's wide swing through Belgium covered a greater distance, Von Bülow's army was expected to strike the Allies some twenty-four hours earlier. Its march, therefore, was in the nature of an onrush.

But Von Bülow was now in the full tide of fighting strength—an amazing spectacle to chance or enforced witnesses. Well may the terrified peasants have stood hat in hand in the midst of their ruined villages. Any door not left open was immediately broken down and the interior searched. Here and there a soldier could be seen carrying a souvenir from some wrecked château. But for the most part everyone fled from before its path, leaving it silent and abandoned. The field gray-green uniforms were almost invisible in cover, in a half light, or when advancing through mist. No conceivable detail seemed to have been overlooked. Each man carried a complete equipment down to handy trifles, the whole weighed to the fraction of an ounce, in carefully estimated proportions.

But this was not enough. Waiting for each column to pass were men with buckets of drinking water, into which the soldiers dipped their aluminum cups. Temporary field post offices were established in advance, so that messages could be gathered in as the columns passed. Here and there were men to offer biscuits and handfuls of prunes. In methodical, machine-like progress came the ammunition wagons, commissariat carts, field kitchens, teams of heavy horses attached to pontoons, traction engines hauling enormous siege guns, motor plows for excavating trenches,

aeroplanes, carriages containing surgeons, automobiles for the commanders, and motor busses in which staff officers could be seen studying their maps. On some of these vehicles were chalked Berlin-Paris. No branch of the service was absent, no serviceable part if it overlooked—not even a complement of grave diggers. It moved forward always at an even pace, as if on parade, with prearranged signals passed down the line when there was any obstacle, a descent or bend in the road.

The tramp of many thousands cast into the atmosphere clouds of fine dust, but even those in rear marched through it as if their lungs were made of steel. No permission was granted to open out for the circulation of air, though it was the month of August. It is safe to assert there was not a single straggler in Von Bülow's army. At the first sign of it he was admonished with a vigor to deter his comrades. Discipline was severely maintained. At every halt the click of heels, and rattle of arms in salute went on down the line with the sharp delivery of orders.

On Wednesday, August 12, 1914, the town of Huy, situated midway between Liege and Namur, was seized. It possessed an old citadel, but it was disarmed, and used now only as a storehouse. Some Belgian detachments offered a slight resistance at the bridge, but were speedily driven off. The capture of Huy gave the Germans control of the railway from Aix-la-Chapelle to France, though broken at Liege by the still standing northern forts. But they secured a branch line of more immediate service, running from Huy into Central Belgium.

On August 15, 1914, Von Bülow's vanguard came within sight of Namur. Before evening German guns were hurling shells upon its forts. Began then the siege of Namur. Namur, being the second fortress hope of the Allies—the pivot upon which General Joffre had planned to swing his army into Belgium in a sweeping attack upon the advancing Germans—a brief survey of the city and fortifications will be necessary. The situation of the city is not as imposing as that of Liege. For the most part it sits on a hillside declivity, to rest in the angle formed by the junction of the Sambre and Meuse. It is a place of some historic

and industrial importance, though in the latter respect not so well known as Liege. To the west, however, up the valley of the Sambre, the country presents the usual features of a mining region—pit shafts, tall chimneys issuing clouds of black smoke, and huge piles of unsightly débris. While away to the north stretches the great plain of Central Belgium, southward the Central Meuse offers a more picturesque prospect in wooded slopes rising to view-commanding hilltops. Directly east, the Meuse flows into the precipitous cut on its way to Liege.

But in Belgian eyes the fame of Namur lay to a great extent in its being the second of Brialmont's fortress masterpieces. Its plan was that of Liege—a ring of outer detached forts, constructed on the same armor-clad cupola principle. At Namur these were nine in number, four major forts and five *fortins*. The distance between each fort was on the average two and a half miles, with between two and a half to five miles from the city as the center of the circumference.

Facing Von Bülow's advance, fort Cognlée protected the Brussels railway, while the guns of Marchovelette swept the space between it and the left bank of the Meuse. In the southwest angle formed by the Meuse, forts Maizeret, Andoy and Dave continued the ring. Again in the angle of the Sambre and Meuse forts St. Héribert and Malonne protected the city. North of the Sambre, forts Suarlée and Emynes completed the circle.

In the emergency Namur possessed one advantage over Liege. The resistance of Liege gave Namur due warning of the German invasion, and some days to prepare for attack. General Michel was in command of the garrison of Namur, which comprised from 25,000 to 30,000 men. Doubtless reports had come to him of the situation at Liege. He immediately set to work to overcome the cause of the failure of Brialmont's plan at Liege, by constructing trenches between the forts, protected by barbed wire entanglements, and mines in advance of the German approach. As his circumference of defense was less than that of Liege, his force promised to be capable of a more prolonged resistance.

Besides the Allies were close at hand. Only eighteen miles

separated him from strong detachments of French infantry and artillery at Dinant. As we have seen French cavalry had been thrown forward as far as Gembloux on the road to Brussels, but ten miles to the northeast of Namur. Somewhere between that place and Charleroi French Chasseurs d' Afrique had advance to occupy outpost positions. His position appeared by no means hopeless—considerably better than the unsupported field army at Liege. The armor of his forts was calculated to withstand the 36-lb. shells of the heaviest German field pieces, but comparatively slight damage was anticipated from the known heavier howitzers. If the Germans purposed to assault Namur in mass formation, as they had done at Liege, General Michel had every reason to feel confident he could replate them with tremendous losses.

But the Germans had learned a severely taught lesson at Liege. They had no intention of repeating those tactics. Behind a remarkable screen of secrecy, they managed to conceal from General Michel—as they did from the Allies—the existence of their enormous siege guns. Whether they brought into action at Namur their famous 42 centimeters, capable of throwing a shell of high explosive power weighing 2,500 lbs., is uncertain. In fact, it is still doubtful where they were first fired at the allied enemy. Two are said to have assisted in the final destruction of the northern forts of Liege, and two were seen rolling over the field of Waterloo. The Germans remained silent upon the subject, and nothing definite about their first discharge was disclosed. But unquestionably their fire was capable of demolishing into ruin any fort on earth within a short period. It is certain, however, the Germans brought against Namur their 28-centimeter guns, and probably some of 21-centimeter caliber. These artillery weapons were quite formidable enough to reduce the Namur forts. The former threw a shell of 750 pounds from a range of three miles—beyond the reach of the Namur guns. The latter projected shells of 250 pounds. The Germans are said to have employed thirty-two of the heavier caliber guns, and a large number of 21 centimeter.

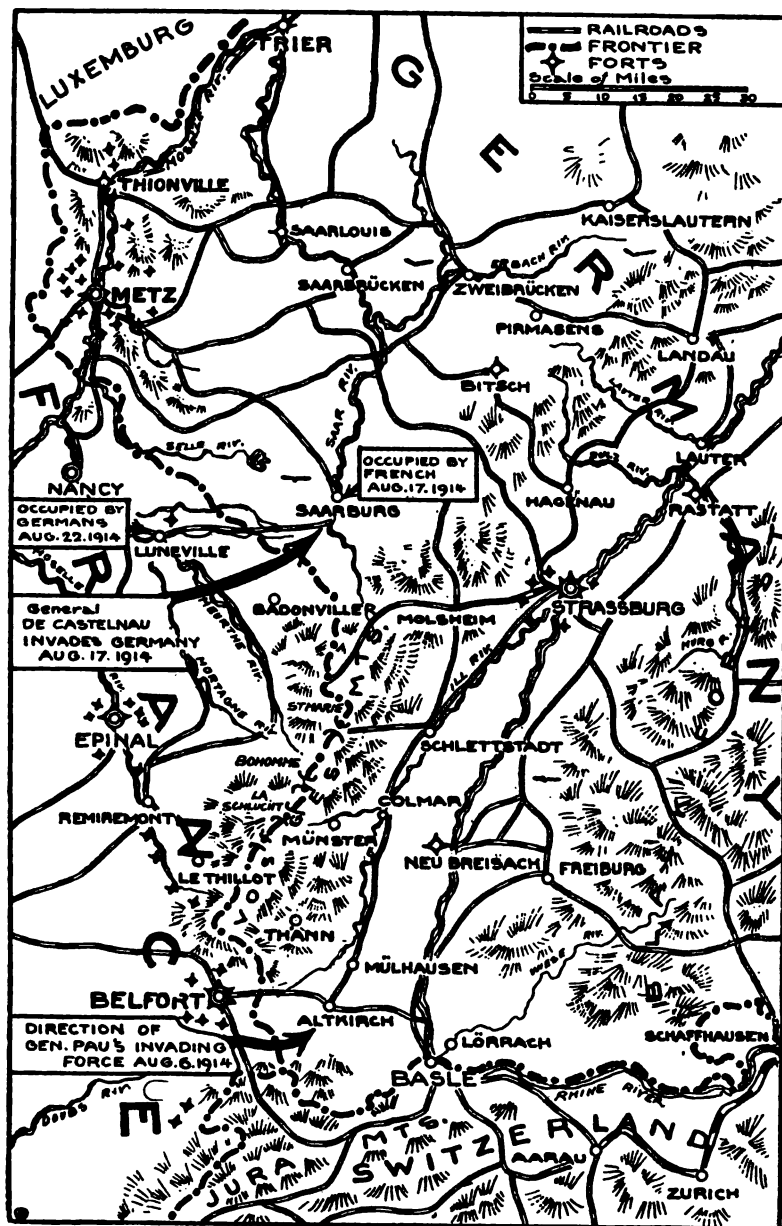

Thus Namur was doomed before the bombardment commenced.

Von Bülow's left wing advanced up the Meuse north bank from Huy, some part of it crossing to the south bank at Ardenne, where it came in touch with the Saxon army.

At sundown of August 20, 1914, Von Bülow was in position before Namur, three miles from its defenses. Darkness fell upon a hot and sultry August atmosphere. Presently the flashes and boom of the German guns began a bombardment of the trenches between forts Cognelée and Marchovelette. It continued through the night. But the Belgian fortress guns were outranged. It would have been a mere waste of ammunition to reply. Neither could the Belgian infantry venture on a counterattack, for the Germans were clearly observed in overwhelming strength. At the outset the Germans devoted their efforts to clearing the trenches of the Belgian infantry, leaving the forts for subsequent demolition. The unfortunate Belgian infantry, therefore, could do nothing but fire intermittent rifle volleys, without any effect upon the Germans. They bravely bore this storm of shells for ten hours. Not a man who lifted his head above the German machine gun-swept parapets but was not instantly killed or wounded. Thus the majority of the officers were killed, and the ranks within the trenches decimated.

Toward morning on August 21, 1914, the Belgians could stand the tornado of death no longer. The demoralized troops fled from the trenches, leaving the gap between forts Cognelée and Marchovelette open. The Germans then opened fire on the forts. In comparison with the new German siege howitzers, the old-fashioned Belgian guns proved to be weak weapons. The tremendous pounding of the German shells not only smashed the fort cupolas, and crumpled into ruin the interior stone and steel protective armor, but quickly put the Belgian guns out of action. Thus while fort Maizeret received some 1,200 German shells at the speed of twenty to the minute, it was able to reply with only ten shots. Forts Marchovelette and Maizeret were the first to fall. Seventy-five men of the Marchovelette garrison were found dead amid its ruins—nearly its total complement.

Early on Friday morning of August 21, 1914, forts Andoy, Dave, St. Héribert and Malonne were subjected to a similar

FRENCH INVASION OF ALSACE-LORRAINE

furious bombardment. After three hours of the cannonade Andoy, Dave and St. Héribert surrendered. During the morning the Germans thrust a force into the southern angle of the Sambre and Meuse. Here the Belgian infantry offered a vigorous resistance. It was hoped that the French at Dinant would hasten to their relief. But Dinant was for the second time within a few days the scene of conflict. Some 6,000 French Turcos and artillery did arrive, but too late to be of use in helping to save Namur. Shells now began to drop in the city while aeroplanes flung down bombs. A thunderstorm rumbled in combination with the continuous roar of the German guns. A panic took hold of the citizens. Distracted men, women and children huddled together in spellbound terror, or sought the shelter of their cellars. The more superstitious pronounced this to be the end of all things, from the eclipse of the sun which darkened the sky. Fort Malonne succumbed sometime during the afternoon of August 21, 1914.

As at Liege, with General Leman, so in Namur General Michel foresaw the city and forts' fate was imminent. Only the northwest forts Suralée, Emynes and Cognelée held out. The Belgians and French had been defeated by the Germans in the angle of the Sambre and Meuse. The horizon revealed no sign of a French army advancing. General Michel, therefore, decided upon the evacuation of the city by the Belgian infantry. It was successfully accomplished, though even more in the nature of a flight than at Liege. But General Michel went with them, instead of remaining, like General Leman, to fight the defense of his fortress to the last.

The retreating Belgians on August 22, 1914, had some adventurous wandering before them. They had first to cut their way through a body of German troops, then to become involved with a French force near Charleroi. It took them seven days to reach Rouen by way of Amiens. There they were embarked for sea transport to Ostend. At Ostend, they joined the main Belgian army after its retreat from Antwerp.

On Sunday morning, August 23, 1914, the Germans began the bombardment of Fort Suarlée. This fort repeated the heroic

resistance of Fort Boncelles at Liege. It held out until the afternoon of August 25. It was apparently then blown up by the explosion of its own magazine, thus again repeating the end of Fort Loncin at Liege. Meantime the Germans had succeeded in reducing Forts Cognelée and Emines.

The Germans entered Namur on the afternoon of August 23, 1914. There seems to have been some oversight in the plan, for the advance guard found themselves under fire of their own guns directed upon the citadel and the Grande Place. This, however, was speedily rectified. Their behavior was much the same as at Louvain and Brussels. They marched in with bands playing and singing patriotic songs. Proclamations were at once issued warning the citizens not to commit any hostile act. The inhabitants were far too cowed to contemplate anything but submission. Good discipline was preserved, and though the city took fire that night there is nothing to show it was from German design. The citizens were induced to come forth from their cellars and hiding places to reopen the cafés and shops.

General von Bülow entered Namur on Monday morning August 24, 1914. He was accompanied by Field Marshal Baron von der Goltz, recently appointed Governor General of Belgium. Previous to the former Balkan war he had been employed in reorganizing the Turkish army. An onlooker in Namur thus describes the German Field Marshal:—"An elderly gentleman covered with orders, buttoned in an overcoat up to his nose, above which gleamed a pair of enormous spectacles."

General Michel attributed his defeat to the German siege guns. The fire was so continuous upon the trenches that it was impossible to hold them, and the forts simply crumpled under the storm of shells. But back of General Michel's plea the allied Intelligence Departments lacked efficiency or energy, or both, in not gaining more than a hint, at any rate, of the enormous German siege guns until they were actually thundering at the gates.

CHAPTER VIII

BATTLE OF CHARLEROI

TOWARD the end of the third week of August, 1914, the atmosphere of every European capital became tense with the realization that a momentous crisis was impending. It was known that the French-British armies confronted German armies of equal, if not of superior strength. In Paris and London the military critics wrote optimistically that the Germans were marching into a trap.

The British army had arrived at the front in splendid fighting trim. It was difficult to restrain the impetuous valor of the French soldiers. The skies were bright and there was confidence that the Germans would unquestionably meet with a crushing defeat. Let us glance at the line of the French and British armies stretched along the Belgian frontier. It ran from within touch of Namur up the right bank of the Sambre, through Charleroi to Binche and Mons, thence by way of the coal barge canal just within the French frontier to Condé. For the choice of a great battle ground there was nothing particularly attractive about it in a military sense.

There is evidence to show in an official communiqué from General Joffre published on August 24, 1914, that it was intended to be merely the left wing of a gigantic French battle offensive—on the adopted German plan—from Condé to Belfort. "An army," runs the communiqué, "advancing from the northern part of the Woerwe and moving on Neufchâteau is attacking the German forces which have been going through the Duchy of Luxemburg and are on the right bank of the Sarnoy. Another army from the region of Sedan is traversing the Belgian Ardennes and attacking the German forces marching between the Lesse and the Meuse. A third army from the region of Chimay has attacked the German right between the Sambre and the Meuse. It is supported by the English army from the region of Mons."

These attacks comprised chiefly the battle of Dinant and cavalry skirmishing, but the purpose of General Joffre was otherwise made plain in throwing advance French troops across the Belgian frontier into Ligny and Gembloux on the road to a recapture of Brussels. This we have previously noted in another connection. The rout of the French army in Lorraine, however, put an end to the grand Condé-Belfort offensive.

Thus the Namur-Condé line became a main defensive position instead of an offensive left wing sweep through Belgium upon Germany. As such it was well enough—if its pivot on the fortress of Namur held secure. Liege had already proved its vulnerability, but it would seem that the French General Staff joined with General Michel, the Commander of Namur, in believing the Namur forts would give a better account. The French General Staff were informed of the approximate strength of the advancing armies of Von Kluck and Von Bülow, and had nothing to fear from inferiority in numbers. The staff never gave out the strength of their forces, but there is reason for believing the great armies were nearly equally matched after mobilization—about 1,200,000 men.

Let us now see what was developing in the Ardennes away to the French right. It has been established that woods, particularly in summer, form the best cover from the observation or attacks of airmen. The spreading, leafy boughs are difficult to penetrate visually from a height of even a few hundred feet, at least to obtain accurate information of what is transpiring beneath.

French air scouts brought in correct information that they had seen the armies of the Duke of Württemberg and crown prince massed along the southern Luxemburg and Belgian forest region. But under the foliage there was another army unseen—that of General von Hausen. The French moved their Fifth Army up to position on the line of the Sambre. They advanced their Third Army, commanded by General Ruffey, upon Luxemburg, and their Fourth Army under General de Langle de Cary across the River Semois to watch the Meuse left bank and gain touch with General Lanzerac. General de Cary came from Sedan,

throwing out detachments upon the Meuse left bank. These operations were to confront the armies of the Duke of Württemberg and crown prince.

But the French apparently knew nothing of the movements of the army of General von Hausen. Their air scouts either could not distinguish it from the armies of the Duke of Württemberg and the crown prince, amid the forest of the Ardennes, or they did not observe it at all. To the army of General von Hausen there clings a good deal of mystery. When last noted by us, previous to the minor battle of Dinant, it had been formed by forces drawn from the armies of the Duke of Württemberg and crown prince. Ostensibly at that time, it was destined to support, as a separate field force, the armies of Von Kluck and Von Bülow.

Possibly the Germans had begun to doubt how long Liege could hold out. Von Kluck was compelled to mark time in his impetuous march on Central Belgium. His losses had been heavy. Support in strength seemed urgent. But this need passed as the Liege forts fell one after the other under the fire of the German siege guns. General von Hausen was released for action elsewhere. Thus we may assume, he was ordered to follow the armies of the Duke of Württemberg and crown prince down through the Ardennes to strike the Meuse south of Namur. By this time he had been substantially reenforced. Now under his command were the complete Twelfth and Nineteenth Corps, and the Eleventh Reserve Corps. Also a cavalry division of the Prussian Guard, with some other detachments of cavalry. His Eleventh Reserve Corps were Hessians, the Twelfth and Nineteenth Corps were Saxons. The latter two corps were regarded as among the best in the German army. In the Franco-Prussian War they fought with conspicuous bravery through every battle in which they were engaged. They won the battle for Prussia at Gravelotte by turning the French right and capturing St. Privat. They marched to Sedan under the crown prince—subsequently the Emperor Frederick—to occupy the first line in the hard fighting of the Givonne Valley. During the siege of Paris they occupied a part of the German northern line, finally to march in triumph

into Paris. This infantry and cavalry of the Prussian Guard stiffened Von Hausen's force into an army of battle strength.

We have thus two factors to bear in mind with regard to the French defensive position at Charleroi—the resisting power of the Namur forts, and the unknown, to the French, proximity of Von Hausen's army.

However substantial was the measure of reliance that the French General Staff and General Michel placed on the Namur forts, evidently General von Bülow regarded them as little more than passing targets for his siege guns. He seemed to have made a comparatively simple mathematical calculation of almost the number of shells necessary to fire, and the hours to be consumed in reducing the Namur forts to masses of débris.

We can picture General von Bülow as he sat in the motor car with Marshal von der Goltz—the old gentleman with an overcoat buttoned up to his nose in August, and huge spectacles. Doubtless discussion ran mainly upon the impending attack of their Second Army on the French right. Emphasis would have been laid on the positions of the armies of the Duke of Württemberg and crown prince advancing away to their left upon the forces of the French Generals Ruffey and de Cary. But there was apparently a German gap here between Von Bülow's army and the armies of the Duke of Württemberg and crown prince, though we noticed previously Von Bülow's army came in touch with Saxon troops half way between Huy and Namur, when a detachment of Von Bülow's left wing was thrown across the Meuse at Ardenne. This gap was faced by the French extreme right resting on the southward Namur bend of the Meuse. It was possibly the "trap" military critics of the moment foresaw for the Germans. Quite likely the two German generals Von Bülow and Von der Goltz, chatting in their motor car, referred to this gap, and it is hardly a stretch of imagination to suggest a twinkle in the huge glasses of the old gentleman in the August overcoat, when now and then the name of Von Hausen was mentioned.

The German attack on the French right began early in the morning of Friday, August 21, 1914. A party of German hus-

sars crossed the Meuse, rode through Charleroi, and trotted on toward the Sambre. At first they were mistaken for a British cavalry patrol. Probably the populace in Charleroi were not sufficiently familiar at that time with the British hussar uniform to distinguish it from the German. In all armies hussar uniforms bear a close resemblance. A French officer, however, presently detected the situation. After a skirmish the German hussars were driven off with the loss of a few killed and wounded. But the raid evidently came out of the gap as a surprise to the French. The citizens were promptly ordered to their homes. Barricades were raised in the streets, and mitrailleuses were placed in sweeping positions. An artillery engagement began at Jemeppe, nine miles above Namur on the left bank of the Sambre, between Von Bülow's vanguard and the main French right. Later in the day Von Bülow's vanguard artillery had advanced to open fire on Charleroi and Thuin, seven miles beyond.

On Saturday, August 22, 1914, Von Bülow attacked Charleroi in full strength. As we have seen, he had already practically settled with Namur. Their main assault on Saturday was delivered on the Sambre bridges at Chatelet and Thuin, below and above Charleroi, respectively. Some time on Saturday they succeeded in crossing to turn Charleroi into one of the most frightful street battle grounds in history. The conflict raged for the possession of iron foundries, glass works, and other factories. The thoroughfares were swept by storms of machine-gun fire. Tall chimneys toppled over and crashed to the ground, burying defenders grouped near under piles of débris. Desperate hand-to-hand encounters took place in workshops, electric-power stations, and manufacturing plants. The normal whirl of machinery, now silent, was succeeded by the crack and spitting of continuous rifle fire.

The French-Turco and Zouave troops fought with savage ferocity, with gleaming eyes, using bayonets and knives to contest alleys and passageways. House doors were battered in to reach those firing from upper windows. Roofs and yard walls were scaled in chase of fleeing parties. The Germans were driven out of Charleroi several times, only to return in stronger

force. Similarly with the French. With each change of victors, the losing side turned to bombard with a torrent of artillery shells the war-engulfed city.

At nightfall on August 22, 1914, Charleroi burst into flames. A dread and significant glow fell upon the sky. Absent were the usual intermittent flare of blast furnaces. The greater part of Charleroi had become a heap of ruins. Those of its citizens still alive cowered in holes or corners for shelter.

The battle of Charleroi went on throughout the night. Early on the morning of Sunday, August 23, 1914, Von Hausen swept down through the gap between the armies of Von Bülow and the Duke of Württemberg. He crossed the Meuse, drove from before him the French detachments watching it, and advanced to attack the rear of the French right.

Von Hausen took the French at Charleroi completely by surprise. At the moment they could comprehend neither where he came from nor the measure of his strength. But he was in army force.

The French were compelled to withdraw their right from Charleroi. Von Hausen seized the advantage to hurl his forces upon their rear, while Von Bülow thundered in assault more vigorously than ever on the French front. A powerful force was hurled upon them from an unexpected direction. Presently the retreat of the French Fifth Army was threatened by the two Saxon corps of Von Hausen's army, pressing on the French right flank and rear. In this emergency the retirement of the French Fifth Army appears to have been undertaken with spontaneous realization of utmost danger. It gave way before the attacks of Von Bülow and Von Hausen to move southward, leaving their British left wing without information of defeat.

CHAPTER IX

BATTLE OF MONS

ON Friday, August 21, 1914, the British force began to take position on the French left, forming the line Binche-Mons-Condé. When finally concentrated it comprised the First and Second Army Corps, and General Allenby's cavalry division. The regiments forming the cavalry division were the Second Dragoon Guards, Ninth Lancers, Fourth Hussars, Sixth Dragoon Guards, with a contingent of the Household Guards. The First Army Corps was given the right of the line from Binche to Mons. It was commanded by Sir Douglas Haig. He was a cavalry officer like the commander in chief, and a comparatively young man for such a responsibility, but had seen active service with credit. His corps was comprised of six guards' battalions. The First Black Watch, Second Munster Fusiliers, The Royal Sussex, North Lancashire, Northampton, Second King's Royal Rifles, Third West Surreys, The South Wales Borderers, Gloucesters, First Welsh Regiment, Highland Light Infantry, Connaught Rangers, Liverpools, South Staffords, Berkshires, and First King's Royal Rifles. The First Irish Guards went into action for the first time in its history.

The second corps extended from Mons to Condé, commanded by Sir Horace Smith-Dorrien. General Dorrien was a west of England man, and turning fifty-six. He had seen active service in the Zulu War, Egypt, Sudan, the Chitral Relief Force, and Tirah campaign. He had occupied the positions of adjutant general in India, commander of the Quetta division, and commander in chief at Aldershot. He was recognized as a serious military student, and possessing the approval and confidence of Lord Kitchener. The Second Corps was composed of Royal Irish Rifles, Wiltshires, South Lancashires, Worcesters, Gordons, Royal Scots, Royal Irish, Middlesex, Royal Fusiliers, Northumberland Fusiliers, Royal Scots Fusiliers, Lincolns, Yorkshire Light Infantry, West Kent, West Riding, Scottish Borderers,

Manchesters, Cornwalls, East Surreys, and Suffolks. To the rear Count Gleichen commanded the Norfolks, Bedfords, Cheshires, and Dorsets. On the left of the Second Corps was stationed General Allenby's cavalry.

In passing we may note that the commander in chief of the British forces was a cavalry officer, the commander of the First Army Corps a cavalry officer, and that the cavalry was in comparatively ample force. Von Mackensen of the German force came from that branch of the service. Cavalry officers are excellent soldiers, but their training as such is not promising for the command of modern armies, mainly of infantry and artillery, with other complements. In war much has changed since Waterloo, with the value of cavalry retreating into the background as aeroplanes sweep to the front for scouting and other purposes.

From Binche to Condé the line assigned to the British was approximately twenty-five miles. Their force totaled some 75,000 men with 259 guns. General French, therefore, had 2,500 men to the mile of trenches. What is known as extended order has thus found increasing favor since Waterloo, when Napoleon massed 30,000 men to the mile. Not very long since 10,000 men was considered the desirable force for a mile of defense. General French's Third Army Corps having been utilized elsewhere, he was compelled to use his cavalry in four brigades as reserve.

Previous to the German attack on Charleroi, General Joffre still held to his plan of a left-wing attack, or rather a counter-attack after the Germans were beaten. But battles were commencing on other fronts, properly belonging to the general retreat, which made its execution doubtful even in an hour of victory. The capture of Charleroi, of course, dissipated it as a dream. That General French realized the superiority in numbers of Von Kluck's army advancing upon him is not apparent, that he comprehended their overwhelming strength of infantry and artillery is nowhere suggested. His airmen had merely brought in the information that the attack would be in "considerable force." The French Intelligence Service were led to believe and informed the British commander that Von Kluck was advancing upon him with only one corps, or two at the most. Some of Gen-

eral French's cavalry scouting as far toward Brussels as Soignes, during the 21st and 22d, confirmed it. But the British proceeded to prepare for attack immediately on taking position. They set to work digging trenches.

While continuing their defensive efforts through Saturday, August 22, 1914, there floated to them a distant rumble from the eastward. Opinions differed as to whether it was the German guns bombarding Namur, or a battle in progress on the Sambre. For the most part British officers and men had but a vague idea of their position, or the progress of the fighting in the vicinity. Even the headquarters staff remained uninformed of the desperate situation developing on the French right at Charleroi.

The headquarters of the British army was at Mons. It lies within what is known as "le Borinage," that is the boring district of Belgium, the coal-mining region. In certain physical aspects it much resembles the same territory of Pennsylvania. Containing one or two larger towns such as Charleroi and Mons, it is sprinkled over with villages gathered near the coal pits. Everywhere trolley lines are to be seen running from the mines to supply the main railways and barge canals.

Formerly the people were of a rough, ignorant and poverty toiling type, but of late years have greatly improved with the introduction of organized labor and education. Previous bad conditions, however, have left their mark in a stunted and physically degenerate type of descendants from the mining population of those times. In contrast to latter comers they resemble a race of dwarfs. The men seldom exceed four feet eight inches in height, the women and children appear bloodless and emaciated.

The output of the Borinage coal field exceeds twenty million tons a year. Its ungainly features of shafts, chimneys, and mounds of débris are relieved in places by woodlands, an appearance of a hilly country is presented where the pit mounds have been planted with fir trees. Apart from its mining aspect, Mons is a city of historic importance. It contains a Gothic cathedral and town hall of medieval architectural note. It also, cherishes a special yearly fête of its own on Trinity Sunday, when in the parade of the Limeçon, or snail, the spectacle of St.

George and the Dragon is presented. With great pride the citizens of Mons showed the British soldiers of occupation an ancient cannon, claimed to have been used by their forefathers as an ally of the English at Crecy.

Especially east of Mons, toward Binche, the British line ran through this district. Several of the greatest European battles have been fought in its vicinity—Ramilles, Malplaquet, Jemeppe, and Ligny.

The night of Saturday, August 23, 1914, passed peacefully for the British soldiers, still working on their trenches. But distant boom of guns from the East continued to vibrate to them at intervals. Of its portend they knew nothing. Doubtless as they plied the shovel they again speculated over it, wondering and possibly regretting a chance of their having been deprived of the anticipated battle.

Sunday morning, August 24, 1914, dawned brightly with no sign of the enemy. In Mons and the surrounding villages the workmen donned their usual holiday attire, women stood about their doors chatting, children played in the streets. Church bells rung as usual summoning to public worship. General French gathered his generals for an early conference. General Joffre's message on Saturday morning, assured General French of victory, and positively informed him that Von Kluck was advancing upon him with no more than one or two army corps. In testimony of it, General French thus wrote a subsequent official dispatch.

"From information I received from French headquarters, I understood that little more than one or at most two of the enemy's army corps, with perhaps one cavalry division were in front of my position, and I was aware of no outflanking movement attempted by the enemy" (Von Hausen's advance on the right) "I was confirmed in this opinion by the fact that my patrols encountered no undue opposition in their reconnoitering operations. The observations of my aeroplanes seemed also to bear out this estimate."

To General French, therefore, his position seemed well secured. In the light of it he awaited Von Kluck's attack with confidence. Toward mid-day some German aeroplanes swept up above the

woods in front, and circled over the British line. British marksmen at once fired on the bodies and hawk-like wings of the intruders.

Some tense interest was roused among the men as British aeroplanes rose to encounter the German aircraft. It was the first real battle of the sky they had witnessed. General French's cavalry patrols now brought information that the woods were thick with German troops, some of them deploying eastward toward their right at Binche.

At twenty minutes to one the first shots swept from the woods upon the British line. Presently, Von Kluck's main attack developed with great rapidity. The German artillery was brought to the front edge of the woods to hurl a storm of shells on the British trenches. It was returned with equal vigor. But very soon it became apparent to British commanders along the line that the German artillery fire was in far greater volume than what might be expected from two army corps, whose normal complement would be some 340 guns. Instead it was estimated 600 German guns were shortly brought into action.

The battle field was described by the Germans as "an emptiness." The term is intended to emphasize that the old martial display and pomp has completely gone. A grand advance upon each other, with trumpets sounding, banners fluttering, brilliant uniforms, and splendid cavalry charges, was impossible with long range weapons hailing storms of bullets and shells of devastating explosive power. Cover was the all important immediate aim of both attack and defense. In this respect as we have seen, the German gray-green uniform assisted by rendering them almost invisible within shelter of such woods as those before Mons. On the other hand, the brown khaki shade of the British field uniforms—originally designed for the same purpose on the sandy wastes of Egypt and Northern India—became conspicuous upon a green background.

As the battle of Mons developed, the British line of the Condé Canal was swept with German shrapnel. German shells, also, began bursting in the suburbs of Mons and in the near-by villages. Sir Douglas Haig's right thus came under strong fire.

German aeroplanes assisted by dropping smoke bombs over the British positions to give the angle of range for their artillery. Thereupon fights above took place between British and German airmen, while the armies beneath thundered shot and shell upon each other. The Germans came on in massed formation of attack. The British were accustomed to attack in open extended line, and their shooting from any available cover was generally excellent. They could not understand the German attack in such close order that they were mowed down in groups of hundreds.

The German infantry rifle fire, breaking from the shelter of the woods to encounter a stronger British fire than was anticipated, was at first ineffective. As to the mass formation they depended upon overwhelming reserves to take the places of those piled in heaps of dead before the British trenches. It was General Grant's "food for powder" plan of attack repeated.

Thus the battle raged upon the entire length of the British line, with repeated advances and retreats on the part of the Germans. Now and then the bodies almost reached the British trenches, and a breach seemed in certain prospect. But the British sprang upon the invaders, bayonet in hand, and drove them back to the shelter of the woods. The Irish regiments, especially, were considered invincible in this "cold steel" method of attack, their national impulsive ardor carrying them in a fury through the ranks of an enemy. But at Mons always the Germans returned in ever greater numbers. The artillery increased the terrible rain of shells. Pen pictures by British soldiers vividly describe the battle somewhat conflictingly.

"They were in solid square blocks, standing out sharply against the skyline, and you couldn't help hitting them. It was like butting your head against a stone wall. . . . They crept nearer and nearer, and then our officers gave the word. A sheet of flame flickered along the line of trenches and a stream of bullets tore through the advancing mass of Germans. They seemed to stagger like a drunken man hit between the eyes, after which they made a run for us. . . . Halfway across the open another volley tore through their ranks, and by this time our artillery began dropping shells around them. Then an officer gave an order and

they broke into open formation, rushing like mad toward the trenches on our left. Some of our men continued the volley firing, but a few of our crack shots were told off for independent firing. . . . They fell back in confusion, and then lay down wherever cover was available. We gave them no rest, and soon they were on the move again in flight. . . . This sort of thing went on through the whole day."

From another view we gather that "We were in the trenches waiting for them, but we didn't expect anything like the smashing blow that struck us. All at once, so it seemed, the sky began to rain down bullets and shells. At first they went wide . . . but after a time . . . they got our range and then they fairly mopped us up. . . . I saw many a good comrade go out."

During the early part of the battle Von Kluck directed his main attack upon the British right, with a furious artillery bombardment of Binche and Bray. This was coincident with the crumbling of the French right at Charleroi by the army of Von Bülow, and its threatened retreat by that of Von Hausen. The retirement of the French Fifth Army, therefore, left General Haig exposed to a strong flank attack by Von Kluck. Confronted with this danger, General Haig was compelled to withdraw his right to a rise of ground southward of Bray. This movement left Mons the salient of an angle between the First and Second British Army Corps. Shortly after this movement was performed, General Hamilton, in command of Mons, found himself in peril of converging German front and flank attacks. If the Germans succeeded in breaking through the British line beyond Mons, he would be cut off and surrounded. General Hamilton informed his superior, General French, of this danger, and was advised in return "to be careful not to keep the troops in the salient too long, but, if threatened seriously to draw back the center behind Mons."

A little after General French had sent General Hamilton this warning, he received a telegram from General Joffre which he describes as "a most unexpected message." General Joffre's telegram conveyed the first news to General French not only that the French Fifth Army had been defeated and was in retreat—

the first intimation even that the French right at Charleroi under General Lanzerac was in peril—but that at least three German army corps were attacking the British. Doubtless the German smashing of General Joffre's planned grand counterattack after the Germans were to be beaten, was disheartening as well as a sore disappointment. General French admirably preserved his courage when finding himself suddenly on the brink of a military catastrophe. Thus far the British left had held their line against the German assault heroically and steadfastly. They might continue to do so, even unsupported by the retreating French, but at the certainty of eventual envelopment and capture.

General French possessed 75,000 men. It was now disclosed that in front Von Kluck was hurling upon him 200,000 men, Von Bülow was hammering on his right, Von Hausen in pursuit of the French threatened his rear, while some 50,000 Germans were enveloping his left. He had no option but to order a retreat. For this he waited until nightfall in the hope of the enemy's attack slackening, to give his men a brief period of rest, and withdraw under cover of darkness. Of its impression on the men a British soldier again writes: "After the last attack we lay down in our clothes to sleep as best we could, but long before sunrise were called out to be told that we had got to abandon our position. Nobody knew why we had to go; but like good soldiers we obeyed, without a murmur. The enemy's cavalry, evidently misunderstanding our action, came down on us again in force; but our men behaved very well indeed, and they gave it up as a bad job. . . . In the retreat we picked off their cavalry by the score."

This writer was probably stationed somewhere along the still well-defended left. On the right and center things had been going badly for the British. Toward evening Mons had become untenable. From German batteries massed along the rim of forest a furious storm of shells was launched upon the city. The Germans followed this up with an infantry attack in force on the western suburbs—following much the same tactics as at Charleroi. General Haig, therefore, was compelled to withdraw to the southern part of the city. The Germans pushed after him.

Here the Irish Rifles and the Middlesex regiment made a determined stand, to suffer heavy casualties. For a time they were cut off, and were in danger of capture or annihilation. The Gordon Highlanders charged to their aid. For the moment they drove the Germans back, and rescued their regimental comrades. Night fell to disclose another scene of conflagration. The suburbs of Mons took fire, and surrounding villages sprang into flame from the bursting of shells. By this light the retreat of the British commenced.

The British account of their Battle of Mons needs no official seal to stamp it as a brilliant military performance on the part of the English, Welsh, Scotch, and Irish soldiers, who fought shoulder to shoulder on the line from Binche to Condé. Among the four there is no second. They marched from the field of Mons determined "to fight it out through another day."

Personal acts of courage were numerous in all the armies. The spirit which animated the soldier at Mons, is well shown in the act of Lance Corporal Jarvis of the Royal Engineers. For a whole hour he worked on indefatigably and resolutely to destroy a bridge at Jameppe, in full observation of the Germans. Then he waited to blow it up in their faces as they began to march upon it. Corporal Jarvis escaped to win the decoration of the Victoria Cross for "conspicuous bravery."

CHAPTER X

THE GREAT RETREAT BEGINS

THE German hosts now stood at the gates of France. It was a mighty spectacle. The soldiery of the Kaiser which had swept their way into Belgium, there to meet the unexpected resistance of the defenders of King Albert, had reached their goal—the French frontier.

About the middle of August, 1914, General Joffre, assigned to the British Expeditionary Force, commanded by Sir John French,

the task of holding Mons against the powerful German advance. The British force formed the left wing of the line of defense that stretched for some two hundred miles close to the Belgian frontier. Extending from Arras through the colliery towns of Mons and Charleroi, the extreme western front of the armies was defended by General D'Amade at Arras, with about 40,000 reserve territorial troops; by General French, with 80,000 British regulars, at Mons; by the Fourth and Fifth French Army of 200,000 first-line troops, under General Joffre and his staff, near Charleroi; and by a force of 25,000 Belgian troops at Namur. The total allied troops in this field of battle were thus about 345,000 men.

Opposed to them, on the north, were about 700,000 German troops, General von Kluck farthest to the west, Generals von Bülow and Von Hausen around the Belgian fortress of Namur, Grand Duke Albrecht of Württemberg in the neighborhood of Maubeuge, and finally, on the extreme left of the German line, the Army of the Moselle, under Crown Prince Wilhelm.

The position of the allied armies was based on the resisting power of Namur. It was expected that Namur would delay the German advance as long as Liege had done. Then the French line of frontier fortresses—Lille, with its half-finished defenses; Maubeuge, with strong forts and a large garrison; and other strongholds—would form a still more useful system of fortified points for the Allies.

The German staff, however, had other plans. At Liege they had rashly endeavored to storm a strong fortress by a massed infantry attack, which had failed disastrously until their new Krupp siege guns had been brought up. These quickly demolished the defenses. These siege guns, therefore, which had thus fully demonstrated their value against fortifications soon brought about the total defeat of the French offensive, and compelled the Allies to retreat from Belgium and northern France. The Germans lost no time in investing Namur, and on Saturday, as noted above, August 22, 1914, the fortress fell into the invaders hands.

On the same day, August 22, 1914, the Fifth French Army, under Generals Langle and Ruffey, was enduring the double stress of Von Bülow's army thundering against its front, and Von Hausen's two army corps pressing hard upon its right flank and rear, threatening its line of retreat. Against such terrific odds the French line at Dinant and Givet broke, exposing the flank and rear of the whole army; and by the evening of that day, August 22, the passages of the River Sambre, near Charleroi, had been forced, and the Fifth Army was falling back, contesting every mile of the ground with desperate rear-guard action. The British, meanwhile, defending the Mons position, were in grave danger of being cut off, enveloped, and destroyed.

Sir John French had put his two army corps into battle array. He had about thirty miles of front to defend, with Mons nearly in the center. On the east was the little town of Condé, connecting by a canal with Mons; on the west were the smaller towns of Bray and Binche, the latter about halfway to Charleroi. The First Army Corps, under General Sir Douglas Haig, was deployed from Mons toward Bray; the Second Corps, under General Sir Horace Smith-Dorrien, was stationed along the Condé-Mons Canal. Guarding Binche was the Fifth Cavalry Brigade, while another body of cavalry, under General Allenby, was kept as a reserve, ready to move to any part of the line that might be threatened.

On Sunday afternoon, August 23, 1914, the full weight of the German onset fell for the first time upon the British. Sir Douglas Haig's front was attacked heavily, and he withdrew his flank to the hills south of Bray. The Fifth Cavalry, halfway to the fallen town of Charleroi, also gave up their position and moved southward. This retirement left Mons a weak place in the battle line, for it then formed a wedge jutting out into the lines of the enemy. Held by the Third Division, under General Hamilton, it was exposed to a raking cross-fire on both sides of the wedge, and to a double attack from either side.

Victorious all along the rest of the allied line, the Germans

BATTLE OF MONS AND RETREAT OF ALLIED ARMIES

now swung out westward in a turning movement against the British, reckoning on an easy victory.

The French meanwhile were in full retreat along the frontier, with the two German armies of the Meuse, flushed with success, pursuing them or marching ahead to get on their flanks; and another hostile force threatening their retreat from a quarter only two days' march in front. In these circumstances the Fifth French Army was unable to help the British on its left at Mons. Hurriedly, desperately, they were fighting their way back, constantly engaging the Germans in pursuit. Their cavalry was soon tired out by charging continually to save guns or infantry, till at last the horses could not move. In fact, it was a question whether the army could save themselves from annihilation or surrender.

In the confusion of retreat the French staff apparently became demoralized, and tidings of the collapse of the Sambre defense on August 22, 1914, were not conveyed to General French until late in the afternoon of Sunday. Then a telegram from General Joffre informed him of the critical situation of the French army, also of the fact that at least three German army corps were advancing against him that very afternoon, while at the same time another corps was making the turning movement from the direction of Tournai. As it afterward appeared, five army corps, with reserves numbering nearly half a million men, were being hurled against the British by the German general staff.

After aeroplane reconnaissance, General French, in order to keep in line with the withdrawing Fifth Army, decided to retire to a safer position resting on the fortress of Maubeuge on the right and extending west to Jenlain, a small town southeast of Valenciennes, on the left. He had already directed that the Mons salient—as a wedge position running into hostile territory is called—should not be held if it were seriously threatened. So, as twilight was beginning to fall on Sunday afternoon, General Hamilton, in obedience to orders dispatched to him scarcely an hour before the receipt of General Joffre's telegram, drew his center back behind the town. At the same time the first stages

of the main retirement began. All heavy transport trains were sent to clear the roads, and a little later the ambulances followed, carrying as many of the wounded as they could accommodate. It was almost midnight before the last outposts withdrew over the canal, where many of them had been firing from loopholes made in the walls of factories.

All that night the British were under the fire of German artillery. In the sultry darkness the red glare of burning villages fired by shells lit up the sky, and here and there along the front there were frequent bursts of rifle fire. In addition to a continual bombardment, which was designed to shake the nerve of the British to keep them sleepless and to wear them out before the next attack, the Germans used powerful searchlights which swept the ground in search of hidden trenches. Wherever these beams of light revealed a trench with men in it a volley of shrapnel followed. The Germans, commanded by Von Kluck, gave their foes no rest in the small hours of Monday morning, August 23, 1914. At sunrise the whole British force stood to arms. To cover the retreat of Sir Horace Smith-Dorrien's Second Corps from the line between Mons and Condé, the British commander in chief, who with his staff was at Bavai, resolved to check the enemy's advance upon his right wing by the menace of a counterattack on Binche from the direction of Harmignies; also, to launch General Allenby's cavalry against the enemy who now were endeavoring to turn the left of the line. While these maneuvers were in progress Smith-Dorrien fell back some five miles, and was joined by the newly arrived Nineteenth Infantry Brigade, which had been hurried up from the lines of communication to Valenciennes and was placed at the near-by hamlet of Quarouble.

The attack from Harmignies having served its purpose, it was discontinued, for the two divisions of Sir Douglas Haig's corps were presently on their way southward. Nevertheless, the British force was still in a very precarious position. Von Kluck's troops, having crossed the canal, were in vigorous pursuit, and Smith-Dorrien's new battle line from Quarouble to the mining village of Frameries was at best only temporary. Furthermore,

General Hamilton's division, while debouching from Mons, had suffered considerable loss from the enemy.

By nightfall, however, Sir Horace Smith-Dorrien's corps, retiring under cover of the cavalry, held the position assigned to it between Bavai and Jenlain. It was protected by the cavalry, and by the Nineteenth Infantry Brigade, posted on its flank between Jenlain and the village of Bry. The right wing, under General French, rested on the fortress of Maubeuge, and from Maubeuge to Bavai the ground was held by Sir Douglas Haig's corps.

Had the French Fifth Army, on French's right, been unbroken or able to extend the line of front eastward beyond Maubeuge, there might have been another battle along the frontier. Now it was out of the question. Twenty-four hours before Sir John French learned from General Joffre that the Germans were moving toward his left flank, General D'Amade had become aware of the move of the Second German Corps advancing on Tournai. Underestimating the strength of the advancing Germans, General D'Amade sent a brigade of territorials to defend the town; but after desperate fighting the French brigade, under the Marquis de Villaret, was surrounded, cut off from retreat, and captured. On the same day a British outpost, which Sir John French had moved out toward Tournai to guard against a surprise attack, was driven back to Cambrai. Von Kluck, after occupying Lille, was thus master of the country to the left of the new British position, and could use his greatly superior force to outflank the British line, roll it up from the left, and jam it against Maubeuge.

Sir John French realized the danger of his Maubeuge-Jenlain position, and felt that not a moment must be lost in retiring to another, though, to quote his own dispatch, "the operation was full of danger and difficulty, owing not only to the very superior force in my front, but also to the exhaustion of the troops."

On Monday evening, August 23, 1914, despite his desire to give the wearied troops some opportunity for rest and reorganization, the British commander, realizing the importance of putting a

substantial barrier, such as the Somme or the Oise, between his force and the enemy, gave orders for the retirement to be continued at five o'clock the next morning, August 24, 1914. He had decided upon a new position about the town of Le Cateau, east of Cambrai.

There was great disappointment among the battalions when they learned that, instead of awaiting the Germans on Tuesday morning in the Maubeuge position, the retreat was to continue; but on the whole the men were in good spirits; they felt that, although retreating, they were not defeated, and were only moving to a stronger position which they could hold.

Before dawn, August 25, 1914, the southward march over rough, hilly country was resumed, General Allenby and the cavalry covering the retreat, Sir Douglas Haig with the First Corps and its guns marching to Maroilles and Landrecies by the road along the eastern border of the forest of Mormal, and the Second Corps to the west of it. Two French reserve divisions were on the right of the British army, and a French cavalry corps, under General Sordêt, had been in billets northeast of Landrecies. General French could count on the aid of these two reserve divisions, but not immediately on Sordêt's exhausted cavalry. He might expect some support from the west, where General D'Amade, with two other reserve divisions, was then near Arras.

During August 23 and 24, 1914, the Second German Corps, as has been noted, had been steadily moving from the direction of Tournai to envelop the British left. Farther to the west a German cavalry division and a battalion of infantry with artillery and machine guns had occupied Lille, and had driven the French in rout from Bethune and Cambrai. They had inflicted another severe defeat on the French at Bapaume, and then they had threatened Arras, up to the time of General D'Amade's arrival. Events in the near future were to require his efficient support.

Toward evening of August 25, 1914, after a long, hard day's fighting march over the highroads, in midsummer heat and thundershowers, the Guards Brigade and other regiments of the

Second Corps, wet and weary, arrived at the little market town of Landrecies. Hoping to have a good rest, they were soon billeted in various houses or in bivouacs in the outlying fields, and they were stretching their legs, about ten o'clock at night, when suddenly the alarm was sounded. The Ninth German Corps had stolen down through the Forest of Mormal and surrounded the town.

Advancing from the woods, the German corps was soon pouring into the half-deserted streets, while the Guards Brigade, hastily summoned to action, were doing their utmost to stem the tide. In the main street the German column, advancing in closest order, found their way disputed by British machine guns, which greeted them with deadly salvos. The head of the column was instantly mowed down, but the Teutons came on, doggedly, daringly, rushing to the destruction in their path. They did not at first even open their close ranks, and it was not until their foremost line had been repeatedly swept away that they hesitated. Then a frightful panic seized them. Turning in rout, heedless of the commands of their officers, who were unable to check the stampede, they turned in their tracks, leaving hundreds of their dead and wounded lying in the street. In many other places throughout the town, where they had taken the side streets, the Germans crossed bayonets with the British in furious hand-to-hand encounters. At last, however, the Germans gave up their assault and fled to the outskirts; but their batteries continued to shell Landrecies for hours, while the British were engaged in sending the wounded by train to Guise and in withdrawing southward toward Wassigny.

Meanwhile another German corps was advancing in force on Maroilles, where General Haig's troops had halted, too exhausted to march farther to fill the gap in the line between Landrecies and Le Cateau. South and east of Maroilles the First Corps was soon heavily engaged with the Germans, who had been tireless in pursuit. Sir John French sent urgent messages to the commander of the two French reserve divisions on his right to come up to the assistance of the First Corps, which they eventually did. Partly owing to the aid of these divisions, but mainly

to the skillful manner in which Sir Douglas Haig extricated his corps from their dangerous position in the darkness of the night, the English forces were able at dawn of Wednesday, August 26, 1914, to recommence their march south toward Wassigny on Guise.

While the night attack on Landrecies was raging, the Germans, taxing their men to the uttermost, marched four other corps through the tract of country between the west side of the forest and the road from Valenciennes to Cambrai. These corps were in a position along Smith-Dorrien's front before dawn of Wednesday, August 26, 1914, and in the earliest hours of the morning it became apparent that the Germans were determined to throw the bulk of their strength against the British regiment which had moved up to a position south of the small town of Solesmes, extending to the south of Cambrai. Thus placed, this force could shield the Second Corps, now beginning retreat from an encircling frontal attack by the German army coming from Tournai. These troops under General Snow were to play an important part in the impending battle of Le Cateau.

By sunrise the guns of the four German corps were firing from positions facing the British left, and gray-green masses of infantry were pressing forward in dense firing lines. In view of this attack, General Smith-Dorrien judged it impossible to continue his retreat at daybreak. The First Corps was at that moment scarcely out of difficulty, and General Sordêt—whose troops had been fighting hard on the flank of the Fifth French Army, with General Lanrezac, against General von Bülow's hosts—was unable to help the British, owing to the exhausted state of his cavalry. The situation was full of peril; indeed, Wednesday bade fair to become the most critical day of the retreat.

Behind the close-formed infantry columns sweeping onward like tidal waves, six hundred guns, outnumbering the British artillery by at least four guns to one, were in action. The British made a splendid stand, and, meeting the advancing hosts with shrapnel, inflicted losses as terrible as their own. During the

first eight hours of the battle the British infantry not only held their ground but also made counterattacks on the enemy, General Allenby's cavalry assisting them in many a gallant charge. The Germans made frequent spirited attacks, bringing up their guns, raking the shallow British trenches, while their airmen, flying overhead, searched for the enemy guns and dropped smoke bombs to indicate the range. At one time the cavalry of the Prussian Guard actually rode into the British line, and were driven back only after a fierce struggle at close quarters with the British infantry, one bayonet against three sabers.

As the day of August 26, 1914, wore on, General von Kluck, abandoning frontal attacks, began to use his superior numbers in a great enveloping move on both flanks, and some of his batteries secured positions from which they could enfilade the British line. Smith-Dorrien, having no available reserves, was thus virtually ringed by enemy guns on one side and by hostile infantry on all sides. "It became apparent," says Sir John French's dispatch, "that if complete annihilation was to be avoided, a retirement must be attempted; and the order was given to commence it about 3.30 p. m. The movement was covered with the most devoted intrepidity and determination by the artillery, which had suffered heavily, and the fine work done by the cavalry in the farther retreat from the position assisted materially in the completion of this difficult and dangerous operation. The saving of the left wing could never have been accomplished unless a commander" (Sir Horace Smith-Dorrien) "of rare coolness had been present to personally conduct the operation."

This retirement foreshadowed the end of the battle. Worn out by repeated repulses, the Germans had suffered too heavily to continue their attacks or to engage in an energetic pursuit. According to General French's estimate, the British losses during the trying period from August 23 to August 26, 1914, inclusive, were between 5,000 and 6,000 men, and the losses suffered by the Germans in their pursuit and attacks across the open country, owing largely to their dense formations, were much greater.

The battle of Le Cateau gave the Germans pause. Further retreat of the British could now be resumed in orderly array; for by now General Sordét with his cavalry was relieving the pressure on the British rear, and General D'Amade with his two reserve divisions from the neighborhood of Arras was attacking General von Kluck's right, driving it back on Cambrai. Disaster to the British forces was averted, though the peril of German interposition between the allied army and Paris would soon compel still further withdrawals.

Covered by their gunners, but still under heavy fire of the German artillery, the British began again to retire southward. Their retreat was continued far into the night of August 26, 1914, and through the 27th and 28th; on the last date—after vigorous cavalry fighting—the exhausted troops halted on a line extending from the French cathedral town of Noyon through Chauny to La Fère. There they were joined by reinforcements amounting to double their loss. Guns to replace those captured or shattered by the enemy were brought up to the new line. There was a breathing space for a day, while the British made ready to take part in the next great encounter.

CHAPTER XI

FIGHTING AT BAY

THE forces of France, also, had been fighting their way southward in these August days of 1914. After the passages of the Sambre were forced, during the great Mons-Charleroi battle, the Fifth French Army was placed in very perilous straits by the failure of the Fourth Army, under General Langle, to hold the Belgian river town of Givet. Hard pressed in the rear by General von Bülow's army, and on their right by General von Hausen commanding the Saxon Army and the Prussian Guard, the Fifth Army of France had to retire with all possible speed, for their

path of retreat was threatened by a large body of Teutons advancing on Rocroi.

On August 23, 1914, holding their indomitable pursuers in check by desperate rear-guard action, with their two cavalry divisions under General Sordêt galloping furiously along the lines of the western flank to protect the retiring infantry and guns, the Fifth Army unexpectedly turned at Guise. At that point General Pau had arrived with reinforcements from Alsace, making the Fifth Army the strongest in France. It now defeated and drove over the Oise the German Guard and Tenth Corps, and then continued its retirement. But the left wing of the French army was unsuccessful, and Amiens and the passages of the Somme had to be abandoned to the invaders.

On Sunday, August 23, 1914, the Fourth Army, operating from the Meuse, was heavily outnumbered by the Saxon army around the river town of Dinant. They fell back, after furious fighting for the possession of the bridges, which the French engineers blew up as the army withdrew southward to the frontier. Soon after, at Givet, the Germans succeeded in wedging their way across the Meuse. Some advanced on Rocroi and Bethel, and other corps marched along the left bank of the Meuse, through wooded country, against a steadily increasing resistance which culminated at Charleville, a town on the western bank of the river. There a determined stand was made.

On August 24, 1914, the town of Charleville was evacuated, the civilians were sent away to join multitudes of other homeless refugees, and then the French also retired, leaving behind them several machine guns hidden in houses, placed so that they commanded the town and the three bridges that connected it with Mézières.

The German advance guards reached the two towns next day, August 25, 1914, which, as we know, witnessed the British retirement toward Le Cateau. Unmolested, they rode across the three bridges into the quiet, empty streets. Suddenly, when all had crossed, the bridges were blown up behind them by contact

mines, and the German cavalymen were raked by the deadly fire of the machine guns. Nevertheless, finding their foes were not numerous, they made a courageous stand, waiting for their main columns to draw nearer. Every French machine gunner was silenced by the Guards with their Maxims; but when the main invading army swept into view along the river valley, the French artillery from the hills around Charleville mowed down the heads of columns with shrapnel. Still the Teutons advanced with reckless courage. While their artillery was engaged in a duel with the French, German sappers threw pontoon bridges across the river, and finally the French had to retire. Between Charleville and Reethel there was another battle, resulting in the abandonment of Mézières by the French.

The retreating army crossed the Semois, a tributary of the Meuse, which it enters below Mézières, and advanced toward Neufchâteau; but they were repulsed by the Germans under the Duke of Württemberg. At Nancy on August 25, 1914, there was another engagement between the garrison of Toul and the army of the Crown Prince of Bavaria; after fierce onslaughts the garrison was compelled to yield and retire. Finally, on August 27, 1914, at Longwy, a fortified town near Verdun, the army of the German Crown Prince succeeded in bursting into France after a long siege, and marched toward the Argonne. Thus from the western coast almost to Verdun there was a general Franco-British retreat.

On August 28, 1914, pressed by the German armies commanded by Von Kluck on the west, by Von Hausen from Dinant and Givet, by Von Bülow from Charleroi and Namur, the Allies were pushed back upon a line stretching roughly from Amiens through Noyon-La Fère to Mézières; while their forces east of the Meuse between Mézières and Verdun were retreating before Duke Albrecht of Württemberg, and to the southeast of Verdun before the Bavarians. All northern France was thus open to the invaders.

After the battle of Le Cateau, however, the Germans slackened their pursuit for a very brief interval; partly because the

terrific strain of marching and fighting was telling upon them no less than upon the Allies, partly because the engineers had blown up the bridges over every river, canal, and stream behind the retreating armies, and partly because, under directions from the French Commander in Chief General D'Amade was organizing a new force on the British left, a new Sixth Army, mainly reserve troops, one corps of regulars, and General Sordêt's cavalry. On the right of the British were General Pau's troops; then, between Pau's Fifth Army and the Fourth Army, came a Ninth Army, under General Foch, formed of three corps from the south.

Still the British position was extremely critical. For six days from August 22 to 28, 1914, they had been driven in forced marches from the Belgian frontier fighting continuously, by day in sun and rain, by night in sultry August heat, over unfamiliar country whose inhabitants, though pathetically grateful and friendly, were yet strangers, speaking a language which most of the soldiers could not understand. Besides, the Germans had by no means given up their pursuit; indeed, five or six corps were soon in full array on the Somme, facing the Fifth Army on the Oise; at least two corps were advancing toward the British front, crossing the Somme east and west of Ham; while three or four other corps were opposing the Sixth Army on the left.

Such was the situation on August 29, 1914. On the evening of the previous day, however, a brigade of British cavalry under General Chetwode, and another brigade commanded by General Gough, fought a brilliant action with the German cavalry moving southeast from St. Quentin. They routed the leading regiments of the column with very severe casualties. This success gave the weary Britons heart; they were not dispirited. Throughout their ranks was the consciousness that General Joffre was constantly working to readjust and improve the fighting forces of France.

The hour had struck for a consultation between the French and British commanders. Should the retreat be continued, or, as France and England alike preferred, should the offensive be re-

sumed? The Germans assuredly were eager for an early and decisive victory.

At one o'clock on August 29, 1914, General Joffre visited Sir John French at his headquarters, and the two commanders held a council of war. Sir John strongly represented his position to the French general, "who was most kind, cordial, and sympathetic." Joffre stated that he had already directed the Fifth Army on the Oise to move forward and attack the Germans on the Somme, with a view to checking pursuit. He also told French of the formation of the Sixth Army on the British left flank. Now, with characteristic rapidity and coolness, he had decided to change his plan of campaign. In spite of the defeat of the German regiments at Guise, August 28, 1914, it was not part of General Joffre's plan to pursue this advantage, and a general retirement on to the line of the Marne was contemplated, to which the French forces in the more eastern theatre of war were ordered to conform. His strategy was now to draw the enemy on at all points, until a favorable situation was created from which to resume the offensive.

From day to day General Joffre had been obliged to modify the methods by which he sought to attain his object, owing to the vicissitudes of the great combat and to the rapid development of the German plans. Having driven the Allies back from the Belgian frontier, the Germans now counted upon Von Kluck being able to crush the British left, while he and Von Bülow struck hard at the Fifth Army; meanwhile the central mass—Von Hausen's, the Duke of Württemberg's, and the Crown Prince's—would break through Langle's army and then combine with Von Kluck and Von Bülow to compel the surrender of all the Allies west of the point where their lines were broken. Such was the German strategy, but in the first weeks of September it underwent a very radical change.

It was imperative to abandon the La Fère-Noyon-Rheims position, because on August 28 and 29, 1914, the three central armies, after forcing the line of the Meuse around Mézières, had followed up the retreating French and driven them out of Rethel. So the

lines of the Somme and the Aisne were to be abandoned, the two generals decided, and the retreat was to be continued to the Marne. Sir John French arranged with General Joffre to effect a short retirement toward a line between Compi  gne and Soissons, promising him to do his utmost to keep within a day's march.

Accordingly, late in the afternoon of August 29, 1914, the British retirement began afresh, and 10,000 French troops also withdrew from the Somme, blowing up the bridges as they went. Everywhere along the roads were crowds of country folk and villagers with wagons and carts piled high with household goods or carrying aged persons and children, all in panic flight before the dreaded invaders, fleeing for refuge in Paris. At various places these stricken multitudes joined the army ambulances taking the shortest routes. Rumors of the coming of the uhlans ran along the straggling lines with tales of the grievous havoc and ruin which these horsemen, vanguards of the German columns, had wrought in the land. Hardly had the retirement begun, when a body of uhlans entered Amiens and demanded from the mayor the surrender of the town. This was formally given, and the civilians were ordered, on pain of death, not to create the slightest disturbance and not to take part in any action, overt or covert, against the soldiery. Afterward, cavalry, infantry, and artillery took possession of the town on August 30, 1914. On the same day a German aeroplane dropped bombs on Paris.

While retiring from the thickly wooded country south of Compi  gne, the British First Cavalry Brigade were surprised while dismounted and at breakfast in the early morning of September 1, 1914. Moving figures on the distant skyline first attracted the attention of those who had field glasses, but in the dim light their identity was not at first revealed. Suddenly all doubt was resolved by a rain of shells on the camp. Many men and a large number of horses were killed. At once the order "Action front!" rang out, and the remaining horses, five to a man, were hurried to cover in the rear, while on the left a battery of horse artillery went into instant action. The German attack

was pressed hard, and the battery was momentarily lost until some detachments from the British Third Corps, with the brigade guns of the artillery, galloped up to its support. Then they not only recovered their own guns, but also succeeded in capturing twelve of the enemy's.

On the eventful day of September 3, 1914, the British forces reached a position south of the Marne between Lagny and Signy-Signets. They had defended the passage of the river against the German armies as long as possible, and had destroyed bridges in the path of the pursuers. Next, at General Joffre's request, they retired some twelve miles farther southward with a view to taking a position behind the Seine. In the meantime the Germans had built highly efficient pontoon bridges across the Marne, and were threatening the Allies all along the line of the British forces and the Fifth and Ninth French Armies. Consequently several outpost actions took place.

By the 1st of September, 1914, the day of the Russian victories at Lemberg, Von Kluck's army had reached Senlis, only twenty-five miles from Paris. Despite this imminent danger, the capital was remarkably quiet and calm; every day, as fateful event crowded upon event, seemed to renew the resolution and coolness of the population. It seemed advisable, however, to transfer the seat of government for the time being from Paris to Bordeaux, after assuring the defense of the city by every means that could be devised.

The defenses of Paris consisted of three great intrenched camps, on the north, east, and southwest, respectively. Of these the most important is the last, which includes all the fortified area to the south and west of the Seine. A railway over sixty miles in length connects all the works, and, under the shelter of the forts, it could not only keep them supplied with the necessary ammunition and stores, but also it could be utilized to convey troops from point to point as they might be needed. However, it was an open secret that even the outer and newer defenses were not of any great strength. If the Germans broke through the outlying circle of forts, the inner line would be of small value, and the city itself would be exposed to long-range bombardment.

Paris was not ready for a siege, and if attacked it would speedily fall.

Early in the morning of September 3, 1914, President Poincaré, accompanied by all the ministers, left Paris, and was followed at noon by the members of the Senate and Chamber of Deputies, and the reserves of the Banque de France. The higher courts were also transferred to Bordeaux. The municipal authority was constituted by the president of the City Council, and the Council of the Seine Department, who were empowered to direct civil affairs under the authority of General Galliéni as military governor, the prefect of Paris, and the prefect of police.

On his appointment to the command, Galliéni did what he could to strengthen the defenses. Trenches were dug, wire entanglements were constructed, and hundreds of buildings that had been allowed to spring up over the military zone of defense were demolished in order to leave a clear field of fire. The gates of the city were barred with heavy palisades backed by sandbags, and neighboring streets also were barricaded for fighting. Certain strategic streets were obstructed by networks of barbed wire, and in others pits were dug to the depth of a man's shoulders. The public buildings were barricaded with sandbags and guarded with machine guns.

But while Paris was preparing for siege and assault the French staff were concentrating their efforts on making a siege impossible by a decisive stroke against the German advance.

Hardly had the Government left the city when tidings arrived that instead of marching on Paris, General von Kluck had swung southeastward toward the crossing of the Marne. This news was obtained by the allied flying corps, which had made daring flights over the enemy's line.

CHAPTER XII

THE MARNE—GENERAL PLAN OF
BATTLE FIELD

ON SEPTEMBER 3, 1914, the bugler of Destiny sounded the "Halt!" to the retreat of the armies of the Allies from the Belgian frontier. The marvelous fighting machine of the German armies, perhaps the most superb organization of military potency that has been conceived by the mind of man, seemed to reach its limit of range. Success had perched upon the German eagles, and for two weeks there had been a steady succession of victories. Nevertheless the British and French armies were not crushed. They were overwhelmed, they were overpowered, and, under stern military necessity, they were forced to give back.

Day after day, under the swinging hammer-head blows of the German drive, the flower of the forces of the Allies had been compelled to break. A little less generalship on the part of the defenders, or a little more recklessness behind that smashing offensive might have turned this retirement into a rout. Even as it was, the official dispatches reveal that, while occasional and local retirements had been considered, such a sweeping retreat was far from contemplated by Generals Joffre and French. German official dispatches bear testimony to the intrepid character of the defenders sullenly falling back and contesting every inch of the way, as much as they do to the daring and the vivid bravery of the German attackers who hurled themselves steadily, day after day, upon positions hastily taken up in the retreat where the retirement could be partly repaid by the heaviest toll of death.

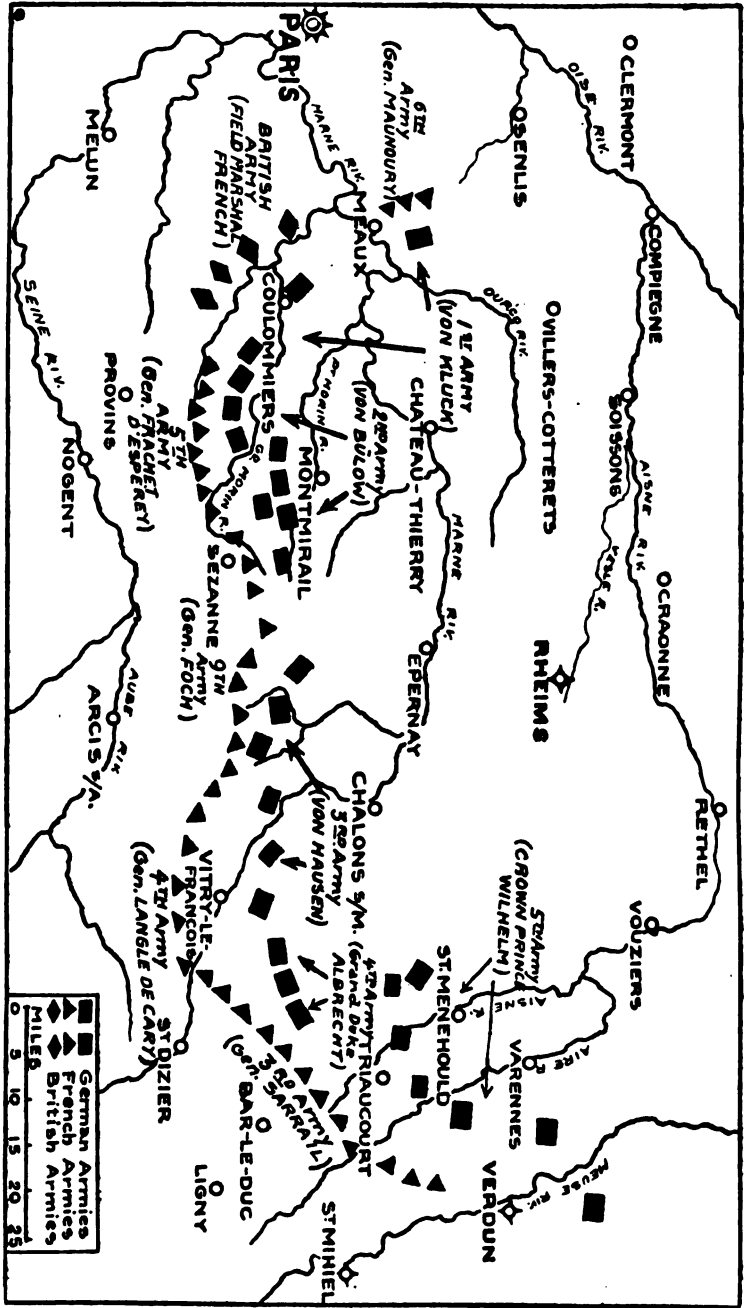

The great strategical plan of the Germans, which had displayed itself throughout the entire operations on the western theatre of war from the very first gun of the campaign, came to its apex on this September 3, 1914. If the allied armies could develop a strong enough defense to halt the German drive at this point, and especially if they could develop a sufficiently powerful counteroffensive to strike doubt into the confident expectations

of the armies of the Central Powers, then the strategical plan had reached a check, which might or might not be a checkmate, as the fortunes of war might determine. If, on the other hand, the stand made by the Allies at this point should prove ineffective, and if the counteroffensive should reveal that the German hosts had been able to establish impregnable defenses as they marched, then the original strategic plan of the attackers must be considered as intact and the peril of France would become greatly intensified.

It is idle, in a war of such astounding magnitude, to speak about any one single incident as being a "decisive" one. Such a term can only rightly be applied to conditions where the opposing powers each have but one organized army in the field, and these armies meet in a pitched battle. None the less, the several actions which are known as The Battles of the Marne may be considered as decisive, to the extent that they decided the limit of the German drive, they decided the integrity of France, east of that line, and they decided the abandonment of Germany's original plan and the substitution therefor of a military policy built upon an entirely different basis. That, when such a need occurred, the German tacticians should have foreseen the possibility and have been prepared for it, is but another of the hundreds of witnesses to the consummate strategical knowledge of the military leaders of the Central Powers. In this regard, therefore, but in this regard alone, can one justly speak of the battles of the Marne as a decisive victory for the Allies.

The scene of the battle ground is one of the most famous in Europe, not even the plains of Belgium possessing a richer historical significance than that melancholy plain, the Champagne-Pouilleuse, upon whose inhospitable flats rested for centuries the curse of a prophecy, that there would the fate of France be decided, a prophecy of rare connotation of accuracy, for it refrained from stating what that fate should be. Yet the historic sense is amplified even more by remembrance than by prophecy, for in the territory confronting that huge arc on which 1,400,000 German and Austrian soldiers lay encamped, awaiting what even the German generals declared to be "the great decision," there lies,

BATTLE OF THE MARNE—BEGINNING ON SEPTEMBER 5, 1914

on the old Roman road running from Chalons a vast oval mound, known to tradition as "the Camp of Attila." In that country, a Roman general, Aetius, leading a host of soldiers of whom many were Gauls, broke a vast flood wave of the Huns as those savage Mongol hordes hurled themselves against Rome's westernmost possession. On that occasion, however, the Visigoths, under their King Theodoric, fought side by side with the Gauls. Then, the dwellers on the banks of the Rhine and on the banks of the Seine were brothers in arms, now, that same countryside shall see them locked in deadly conflict.

The morale of tradition is a curious thing, and often will nerve a sword arm when the most impassioned utterance of a beloved leader may fail. There were few among the soldiers of France who forgot that in the south of this same plain of Champagne-Pouilleuse was the home of Joan of Arc, the Maid of Orleans, patriot and saint, and more than one French soldier prayed that the same voices which had whispered in the ear of the virgin of Domremy should guide the generalissimo who was to lead the armies of France upon the morrow. Here, tradition again found old alliances severed and new ones formed, for the Maid of Orleans led the French against the English, while in the serried ranks awaiting the awful test of the shock of battle, English and French soldiers lived and slept as brothers.

The topography of the region of the battle field is of more than common interest, for modern tactics deal with vaster stretches of country than would have been considered in any previous war. This is due, partly, to the large armies handled, partly to the terrific range of modern artillery, and also to what may be called the territorial perceptiveness which aeronautical surveys make possible to a general of to-day. It is a truism to say that war has changed, but one of the less recognized characters of change is that by which the strategic leader of a modern campaign is compelled to review and to take into account a far larger group of factors. A modern tactician must be more facile to grasp complexities, and must possess a more synthetic mind to be able to reduce all these complicating factors into a single whole. The first factor of the battles of the Marne was the topographical factor,

the consideration of the land over which the action was to take place.

Let the River Marne be used as a base from which this topography can be determined. The Marne rises near Langres, which is the northwest angle of that pentagon of fortresses (Belfort, Epinal, Langres, Dijon, and Besançon), which incloses an almost impregnable recuperative ground for exhausted armies. From Langres the Marne flows almost north by west for about fifty miles through a hilly and wooded country, then, taking a more westerly course, it flows for approximately seventy-five miles almost northwest, across the Plain of Champagne, past Vitry-le-François and Châlons, thence almost due westward through the Plateau of Sézanne, by Epernay, Château Thierry, La Ferté-sous-Jouarre, and Meaux to join the Seine just south of Paris. In the neighborhood of Meaux, three small tributaries flow into the Marne—the Ourcq from the north, and the Grand Morin and Petit Morin from the east. The Marshes of St. Gond, ten miles long from east to west and a couple of miles across, lie toward the eastern borders of the Plateau of Sézanne, and form the source of the Petit Morin, which has been deepened in the reclamation of the marsh country.

Once more considering the source of the Marne, near Langres, it will be noted that the River Meuse rises near by, flowing north by east to Toul, and then north-northwest past Verdun to Sedan, where it turns due north, flowing through the Ardennes country to Namur, in Belgium. To the east of the Meuse lies the difficult forest clad hill barrier, known as the Hills of the Meuse; to the east extends (as far as Triaucourt) the craggy and broken wooded country of the Argonne, a natural barrier which stretches southward in a chain of lakes and forests.

West of this impassible country of the Meuse and the Argonne lies the plain of Champagne-Pouilleuse, which is almost a steppe, bare and open, only slightly undulating, overgrown with heath, and studded here and there by small copses of planted firs, naught but a small portion of the whole being under cultivation. Between the Forest of the Argonne and this great plain, which is over a hundred miles long from north to south and forty miles in

width, lies a short stretch of miniature foothills, with upland meadows here and there, but crossed in every direction by small ravines filled with shrubs and low second-growth timber. Here lies the source of the Aisne, a river destined to live in history; and on the further side begins the great plain.

On the west of the plain of Champagne rises, 300 feet, with a curious clifflike suddenness, the Plateau of Sézanne. The effect is as though a geological fault had driven the original plateau from north to south throughout its entire length, and then as though there had been a general subsidence of the plain, giving rise to the clifflike formations known as Les Falaises de Champagne, at the foot of which runs the road from La Fère-Champenoise to Rheims. Fifty miles still farther west, in the region of Meaux, this plateau formation sinks more gradually into the Plain of Paris.

The disposition and arrangement of the German forces as they confronted this territory is next to be considered. It is to be remembered that their objective was Paris. It is also worthy of remembrance that German tactics have favored flank attack, rather than central attack. From the time of Frederick the Great it had been taught in every Prussian school that the enveloping movement is the most desirable, since the piercing of a line exposed the advancing force to attacks on both flanks. This design, with which the observer is confronted again and again when considering the military movements of the Central Powers on the western battle front, reveals itself on the morning of September 3, 1914, in the position occupied by the German forces, and, correspondingly, in the arrangement of the allied armies.

The German right, on September 3, 1914 and September 4, 1914, at which time it was nearest to its desired goal of Paris, held the banks of the Marne from Epernay to the banks of the little tributary the Ourcq, which runs into the Marne from the north. This extreme right comprised the Second Corps and the Fourth Reserve Corps, encamped on the western bank of the little stream the Ourcq; while the Fourth Corps was given the honor of the tip of the right, being camped on the Marne at La Ferté-sous-Jouarre, supported by the Third Corps, the Seventh

Corps and the Seventh Corps Reserve. The Ninth Cavalry Division occupied an advanced position west of Crécy and the Second Cavalry Division occupied an advanced position near the British army, north of Coulommiers. These troops constituted the First German Army, under the command of General von Kluck.

The Allies' left, confronting this position, held strong reserves, and by the nature of the ground itself, was well placed to prevent any enveloping movement, dear to the German school of military tactics. It rested securely on the fortress of Paris, believed by its constructors to be the most fully fortified city in the world, and should the German right endeavor to encircle the left wing of the Allies, should it develop a farther westerly movement, it would but come in contact with the outer line of those defenses and thence be deflected in such an enormous arc as to thin the line beyond the power of keeping it strong enough to resist a piercing attack at all points. Clearly, then, as long as the extreme left of the Allies remained intact with the defenses of Paris, an enveloping movement was not possible on the easterly flank.

Facing the German extreme right, was the Sixth French Army, one of the great Reserves of General Joffre, which had been steadily building up since August 29, 1914, with its right on the Marne and its left at Betz, in the Ourcq Valley, encamped on the western side of that stream, facing the Second and Fourth Corps of the Germans. The augmentation of that army from the forces at Paris was hourly, and while three or four days before, it had been felt that the Sixth French Army was too weak to be placed in so vital a point—that it should have been supplemented with the Ninth Army—the results justified the French generalissimo's plans and more than justified his confidence in the British Army, or Expeditionary Force, which faced the tip of the German right wing drive and was encamped on a line from Villeneuve le Comte to Jouy le Chatel, the center of the British army being at a point five miles southeast of Coulommiers. This army was under the command of General Sir John French.

The right center of the German line was held by General von Bülow's army, consisting of the Ninth Corps, the Tenth Corps,

the Tenth Reserve Corps, and the Guard Corps. This army also was encamped upon the Marne, stretching from the eastern end of General von Kluck's army as far as Epernay. This army thus held the Forests of Vassy but was confronted by the marshes of St. Gond.

Confronting this right center was, first of all, General Conneau's Cavalry Corps, which was in touch with the east of the British army under Sir John French. Then, holding the line from Esternay to Courtaçon lay the Fifth French Army under General d'Esperey. Full in face of the strongest part of the German right center stood one of the strongest of General Joffre's new reserves, the Ninth Army under General Foch, with the marshes of St. Gond in front of him, and holding a twenty-mile line from Esternay, past Sézanne to Camp de Mailly, a remarkably well-equipped army, very eager for the fray.

The hastily replenished corps, largely of Saxons, which had been General von Hausen's army, lay next to General von Bülow, a little north of Vitry, and as it proved, a weak spot in the German line. The left center of the attacking force was under the command of the Duke of Württemberg and extended across the whole southern end of the plain of Champagne to the upper streams of the Aisne south of St. Menhould. The extreme left of this advanced line was the army of the Imperial Crown Prince, holding the old line on the Argonne to the south of Verdun. In close relation to this advanced line, but not directly concerned with the Battles of the Marne were the armies of the Bavarian Crown Prince, encamped in the plateau of the Woivre, engaged largely in the task of holding open the various lines of communication, while far to the south, in the vicinity of the much battered little town of Mulhouse, lay the remains of the decimated army of the Alsace campaigns under General von Heeringen.

Facing this left center came General Langle's Fourth French Army, covering the southern side of the plain of Chalons, it lay south of Vitry-le-François, and faced due north. On this army, it was expected, the brunt of the drive would fall. At this point the French battle line made a sharp angle, the Third French

Army, commanded by General Sarrail, occupying a base from Bar-le-Duc to Verdun. It thus faced almost west, skirting the lower edge of the Forest of Argonne. At the same time it was back to back with the Second French Army, which covered the great barrier of forts from Verdun to Toul and Epinal, while the First French Army held the line from Epinal to Belfort.

CHAPTER XIII

ALLIED AND GERMAN BATTLE PLANS

SO much for the actual disposition of the armies. The question of preponderance of numbers, of advantages of position, and of comparative fighting efficiency is the next factor with which to be reckoned. The force of numbers was rather with the Allies. About twelve days before this fateful day of September 8, 1914, there were approximately 100 German divisions as against seventy-five French, British, and Belgian divisions. But, during those twelve days, French and British mobilization advanced with hectic speed, while, at the same time, Germany was compelled to transfer fifteen or even twenty of her divisions to the eastern theatre of war. It follows, therefore, that there were about 4,000,000 soldiers in all the armies that confronted each other in the week of September 3-10, 1914, of whom, probably, 3,000,000 were combatants. The most accurate statistics obtainable place the German strength at 1,800,000 combatants, and the Allies at about 1,700,000. On the other hand, the preponderance of efficiency of equipment lay with the Germans, though this, again, was balanced by the advantage of the defending forces in being able to accept the challenge of battle in a place of their own choosing.

The plans of the German campaign at this time, so far as they can be determined from the official orders and from the manner in which the respective movements were carried out, were three-fold. The first of these movements was the order given to Gen-

eral von Kluck to swirl his forces to the southeast of Paris, swerving away from the capital in an attempt to cut the communications between it and the Fifth French Army under General d'Espérey. This plan evidently involved a feint attack upon the Sixth French Army under General Manoury (though General Pare took charge of the larger issues of this western campaign), coupled with a swift southerly stroke and an attack upon what was supposed to be the exposed western flank of General d'Espérey's Army. The cause of the failure of this attempt was the presence of the British army, as has been shown in the alignment of the armies given above, and as will be shown in detail later, in the recital of the actual progress of the fighting. Important as was this movement, however, it was the least of the three elements in General von Moltke's plan for the shattering of the great defense line of the Allies.

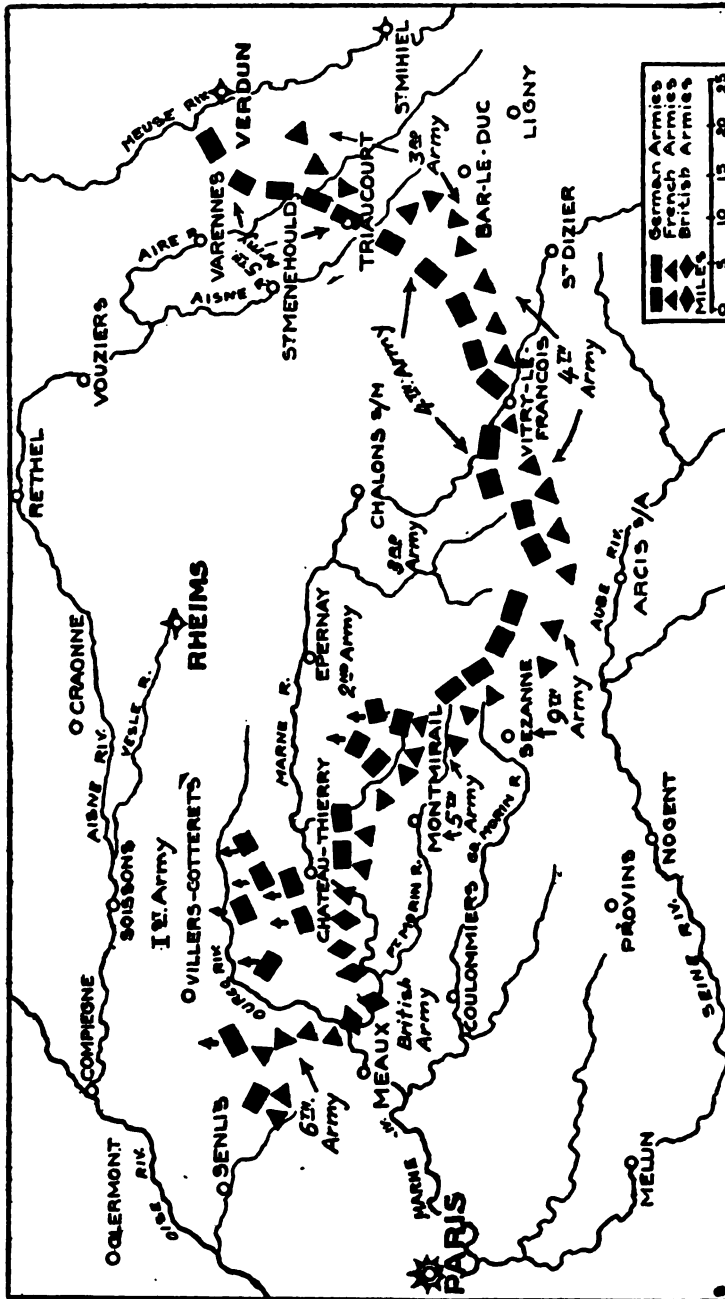

The second element in this plan was, contrary to Germany's usual tactics, the determination to attack the center of the French line and break through. Almost three-quarters of a million men were concentrated on this point. The armies of General von Bülow, General Hausen and the Duke of Württemberg were massed in the center of the line. There, however, General Foch's new Ninth Army was prepared to meet the attack. It will be remembered that, in the disposition of the troops, these respective armies were facing each other across the great desolate plain, the ancient battle ground. If the German center could break through the French center, and if at the same time General von Kluck, commanding the German right, could execute a swift movement to the southeast, the Fifth French Army would be between two fires, together with such part of the Ninth Army as lay to the westward of the point to be pierced. This strategic plan held high promise, and it would have menaced the whole interior of France southward from the plain of Champagne, but even this second part of the plan, important as it was, does not appear to have been the crucial point in the campaign.

The glory of the victory, if indeed victory it should prove, as the successes of the previous two weeks had led the Germans to believe, was to be given to the crown prince. With a great deal

of trouble and with far more delay than had been anticipated, the Crown Prince's Army had at last managed to get within striking distance of the forefront of the great battle line. His forces occupied the territory north of Verdun to a southern point not far from Bar-le-Duc. Here the German secret service seems to have been as efficient, as it failed to be with regard to conditions only fifty miles away. General Sarrail's Army, which confronted the army of the crown prince, was weak to a degree. It consisted of little more than the garrison troops of Verdun. Nor could General Joffre send any reenforcements. Every available source of reenforcements had been drawn upon to aid the Sixth Army, encamped upon the banks of the Ourcq, in order that Paris might be well guarded. No troops could be spared from the Fifth and Ninth Armies, which had to bear the brunt of the attack from the German center. General Sarrail, therefore, had to depend on the natural difficulties of the country and to avoid giving battle too readily against the superior forces by which he was confronted. It was a part of the plan of the French generalissimo, however, to feel the strength of the German center, and if it proved that they could be held, to release several divisions and send them to the aid of General Sarrail.

Subordinate to this contemplated attack by the crown prince, yet forming a part of it, and, in a measure, a fourth element in the campaign, was the double effort from the garrisons of Metz and Saarbrücken, combining with the armies of the Bavarian Crown Prince and the forces of General von Heeringen. The Second French Army, therefore, could not come to the aid of the Third, except in desperate need, for it was in the very forefront of the attack on Nancy. If the German left could pierce the French lines at Nancy and pour through the Gap of Lorraine, it would be able to take General Sarrail's Army in the rear at Bar-le-Duc, and would thus completely hem it in, at the same time isolating Verdun, which, thus invested in the course of time must fall, forming an invaluable advanced fortress to the German advance.

Before proceeding to the actual working out of this plan of campaign it may be well to recapitulate it, in order that each de-

BATTLE OF THE MARNE—SITUATION ON SEPTEMBER 9, 1914

velopment may be clear. The German plan was to pierce the French line at three places, at Meaux, at Bar-le-Duc and at Nancy. General von Kluck, at Meaux, would cut off the Fifth and the Ninth Armies from communication with their base at Paris, the Bavarian Crown Prince would weaken General Sarraill's defense in the rear, and if possible come up behind him, and thus the stage would be set for the great onrush of the Imperial Crown Prince, who, with an almost fresh army, and with a most complete and elaborate system of communication and supplies, should be able to crush the weak point in France's defense, the army under General Sarraill. Such a victory was designed to shed an especial luster upon the crown prince and thus upon the Hohenzollern dynasty, a prestige much needed, for the delays in the advance of the Crown Prince's Army had already given rise to mutterings of discontent. From a strategical point of view the plan was sound and brilliant, the disposition of the forces was excellently contrived, and the very utmost of military skill had been used in bringing matters to a focus.

The French plan, is the next to be considered. From official orders and dispatches and also from the developments of that week, it is clear that General Joffre had perceived the possibility of such a plan as the Germans had actually conceived. He had brought back his armies—and there is nothing harder to handle than a retreating army—step by step over northern France without losing them their morale. The loss of life was fearful, but it never became appalling. The French soldiers had faith in Joffre, even as their faith in France, and, while the Germans had victories to cheer them on, the soldiers of the Allies had to keep up their courage under the perpetual strain of retreat. The administration had evacuated Paris. Everywhere it seemed that the weakness of France was becoming apparent. To the three armies in the field, those commanded severally by General d'Amade, Sir John French, and General Pau, the generalissimo had sent no reinforcements. General Joffre informed the French Government that he was not able to save the capital from a siege. Yet, as after events showed, while these various conditions could not rightly be considered as ruses upon General Joffre's part to

lure on the Germans, there is no doubt that he understood and took full advantage of the readiness of the attacking hosts to esteem all these points as prophetic of future victory. The first feature of the French plan, therefore, was to lend color to the German belief that the armies of the Allies were disheartened and thereby to induce the attacking forces to join the issue quickly.

The second part of the French plan lay in General Joffre's decision not to do the expected thing. With General Sarrail placed at the extremest point of danger, it would have been the most likely piece of tactics to move the entire British Expeditionary Force from the defenses of Paris to the weak point at Bar-le-Duc. There is reason to believe that General von Kluck believed that this had been done.

The third part of the defensive prepared by General Joffre was that of a determination to turn the steady retreat into a counterdrive. Time after time had the other generals implored their leader to give them leave to take the offensive, and on every occasion a shake of the head had been the reply. Sir John French had wondered. But when the French officers found themselves in the region of the Marne, close to the marshes of St. Gond, where in 1814 Napoleon had faced the Russians, they were more content. It was familiar as well as historic ground. Even the youngest officer knew every foot of that ground thoroughly. It was, at the same time, the best point for the forward leap and one of the last points at which a halt could be made.

The fourth part of the plan was the holding fast to the point of Verdun, for thereby the communication of the armies of the Central Powers was seriously weakened. It is to be remembered that this actual fighting army of more than a million men depended for food and for ammunition supplies upon the routes from Belgium and Luxemburg by way of Mezières and Montmédy, and the circuitous line to Brussels via St. Quentin. Had Maubeuge fallen a little earlier the situation of the Central Powers would have been less difficult, and both commissariat and ammunition problems would have been easier of solution. But Maubeuge held out until September 7, 1914, and by that time

the prime results of the battles of the Marne had been achieved. To this problem Verdun was the key, for from Metz through Verdun ran the main line, less than one-half the length of line to the Belgian bases of supplies, and, owing to the nature of the country, a line that could be held with a quarter the number of men. But Verdun stood, and General Joffre held the two armies back to back, converging on the point at Verdun.

Such was the country over which the battles of the Marne were fought, such were the numbers and dispositions of the several armies on each side, and such, as far as can be judged, were the plans and counterplans of the strategic leaders in the great conflict.

CHAPTER XIV

FIRST MOVES IN THE BATTLE

THE first movement in this concerted plan was taken by the German extreme right. This was the closing in of General von Kluck's army in a southeasterly direction. It was a hazardous move, for it required General von Kluck to execute a flank march diagonally across the front of the Sixth French Army and the British Expeditionary Force. At this time, according to the dispatches from Sir John French, the British army lay south of the Marne between Lagny and Signy-Signets, defending the passage of the river and blowing up the bridges before General von Kluck.

On September 4, 1914, air reconnaissances showed that General von Kluck had stopped his southward advance upon Paris, and that his columns were moving in a southeasterly direction east of a line drawn through Nanteuil and Lizy on the Ourcq. Meanwhile, on September 4, 1914, Sir John French more effectually concealed his army in the forests, doing so with such skill that his movements were unmarked by the German air scouts. All that day General von Kluck moved his forces, leaving his heavy artillery with about 100,000 men on the steep eastern bank

of the Ourcq and taking 150,000 troops south across the Marne toward La Ferté Gaucher. He crossed the Petit Morin and the Grand Morin, all unconscious that scores of field glasses were trained upon his troops.

Probably believing that the British army had been hurried to Bar-le-Duc, to the aid of General Sarraill, General von Kluck advanced confidently. Having concealment in view, Sir John French and the commanders of the French armies on either side of him, had left a wide gap between the two armies. Through one of these apparently unguarded openings a strong body of uhlan patrols advanced, riding southward until they reached Nogent, south of Paris, and seemingly with the whole rich country of central France laid wide open to a sharp and sudden attack. Among the many strange features of this series of the battles of the Marne this must certainly be reckoned as one. Though possessing an unequaled military organization, though priding itself on its cavalry scouts, though aided by aerial scouts, and though well supplied with spies, yet Sir John French, with the age-old device of a forest, was able to cloak his movements from this perfectly organized and powerful invading army. Much of the credit of this may be assigned to the French and English aircraft, which kept German scouting aircraft at a distance. But the British general was astounded at the result of his maneuver, which, as he admitted afterward, was to him merely a military precautionary measure against the discovery of artillery sites, and a device to keep the enemy in general ignorance.

On Saturday, September 5, 1914, at the extreme north of the line of the two armies facing each other across the Ourcq, an artillery duel began. The offensive was taken by the French, and though in itself it was not more striking than any of the artillery clashes that had marked the previous month's fighting, it was significant, for it marked the beginning of the battles of the Marne. The plans of General Joffre were complete, but the actual point at which the furious contest should begin was not yet determined. In the northern Ourcq section, however, the realization by the French that they were actually on the offensive at last, that the long period of retreat was over, could not be

restrained. The troops were eager to get to work with the bayonet, and greatly aided by their field artillery, in which power had been sacrificed to mobility, they quickly cleared the hills to the westward of the Ourcq. By nightfall of September 5, 1914, the country west of the Ourcq was in French hands. But to cross that river seemed impossible. General von Kluck's heavy artillery had been left behind to hold that position, and every possible crossing was covered with its own blast of death.

Here General von Kluck's generalship was successful. It might have been regarded as risky to leave 100,000 men to guard a river confronted by 250,000 picked and reenforced French troops. But General von Kluck's faith in German guns and German gunnery was not ill-founded. This was the first of the open-air siege conflicts, and the French army had no guns which could be used against the German heavy artillery. Hence it followed that the brilliant work of the Sixth French Army on this first day of the battles of the Marne achieved no important result, for the long-range hidden howitzers, manned by expert German gunners and well supplied with ammunition, defied all attempts at crossing the little stream of the Ourcq.

This first day's fighting on the Marne revealed one of France's chiefest needs—heavy artillery. The French light quick-firing gun was a deadly weapon, but France had neglected the one department of artillery in which the Germans had been most successful—the use of powerful motor traction to move big guns without slackening the march of an army. General von Kluck's artillery was impregnable to the French. Indeed, the Germans could not be dislodged from the Ourcq until the British Expeditionary Force sent up some heavy field batteries. It was then too late for the withdrawal from the Ourcq to be of any serious consequence in determining the result along the battle front.

The afternoon of that day, when the Zouaves were driving the Germans across the Ourcq with the bayonet and were themselves effectually stopped by the German wall of artillery fire, General Joffre and Sir John French met. At last the British commander received the welcome news from the generalissimo that retreat was over and advance was about to be begun.

"I met the French commander in chief at his request," runs the official dispatch, "and he informed me of his intention to take the offensive forthwith by wheeling up the left flank of the Sixth Army, pivoting on the Marne, and directing it to move on the Ourcq; cross and attack the flank of the First German Army, which was then moving in a southeasterly direction east of that river.

"He requested me to effect a change of front to my right—my left resting on the Marne and my right on the Fifth Army—to fill the gap between that army and the Sixth. I was then to advance against the enemy on my front and join in the general offensive movement. German troops, which were observed moving southeast up the left bank of the Ourcq on the Fourth were now reported to be halted and facing that river. Heads of the enemy's columns were seen crossing at Changis, La Ferté, Nogent, Château-Thierry, and Mezy.

"Considerable German columns of all arms were seen to be converging on Montmirail, while before sunset large bivouacs of the enemy were located in the neighborhood of Coulommiers, south of Rebais, La Ferté-Gaucher, and Dagny.

"These combined movements practically commenced on Sunday, September 6, at sunrise; and on that day it may be said that a great battle opened on a front extending from Ermenonville, which was just in front of the left flank of the Sixth French Army, through Lizy on the Marne, Maupertuis, which was about the British center, Courtecon, which was the left of the Fifth French Army, to Esternay and Charleville, the left of the Ninth Army under General Foch, and so along the front of the Ninth, Fourth, and Third French armies to a point north of the fortress of Verdun."

Sunrise on Sunday morning, on a summer day in sunny France, was the setting for the grim and red carnage which should show in the next five consecutive days that the German advance was checked, that the southernmost point had been reached, and that for a long time to come it would tax the resources of the invaders to hold the land that already had been won. General Joffre had so arranged his forces that the most spectacular—and the easiest

—part fell to the British, and it was accomplished with perfection of detail. But the honors of the battles of the Marne lay with General Sarraill's army and with the "Iron Division of Toul."

As before, the day's fighting began with the efforts of the Sixth French Army against the Ourcq. Before the Germans could be driven from the east bank the few villages they occupied on the west bank had to be taken, and as these were covered by heavy artillery from the further bank, the French loss of life was very severe. Yet these several combats—of which there were as many as there were villages—were stationary. In every case the Germans were compelled to cross the river; in every case the artillery made it impossible for the French to follow them.

At dawn also every one of the French armies advanced, and within two or three hours of sunrise found themselves engaged with the German front. The spirited order to the troops issued that morning by General Joffre had left no doubt in the minds of Frenchmen on the importance of the issue. It read:

"At a moment when a battle on which the welfare of the country depends is going to begin, I feel it incumbent upon me to remind you all that this is no longer the time to look behind. All our efforts must be directed toward attacking and driving back the enemy. An army which can no longer advance must at all costs keep the ground it has won, and allow itself to be killed on the spot rather than give way. In the present circumstance no faltering can be tolerated."

Yet in spite of the powerful efforts of the French armies, so thorough was the organization of the German forces, and so ably handled were they, that not a single one of the French armies could make any headway, and the point of the principal German attack—as it proved—the crown prince's pressure on General Sarraill, was already forcing that weak but heroic body of men southward along the hills of the Meuse. So far German strategy appeared perfect. The French armies were all held in check, and General Sarraill was beginning to give way.

That same dawn, however, was to bring a third factor into

play. As the mists of morning rolled away, this special army order was issued by Sir John French and read to the British troops:

"After a most trying series of operations, mostly in retirement, which have been rendered necessary by the general strategic plan of the allied armies, the British forces stand to-day formed in line with their French comrades, ready to attack the enemy. Foiled in their attempt to invest Paris, the Germans have been driven to move in an easterly and southeasterly direction with the apparent intention of falling in strength on the Fifth French Army. In this operation they are exposing their right flank and their line of communications to an attack from the combined Sixth French Army and the British forces.

"I call upon the British army in France to now show the enemy its power and to push on vigorously to the attack beside the Sixth French Army.

"I am sure I shall not call upon them in vain, but that, on the contrary, by another manifestation of the magnificent spirit which they have shown in the past fortnight, they will fall on the enemy's flank with all their strength and, in unison with the Allies, drive them back."

The air was filled with the sullen tumult of distant artillery, and in the small villages near by, south of the line, the bells were calling the women and children to church—all the men had gone to the battle line—as the British forces crept through the forest of Crécy. In spite of the report of his uhlans that the British were nowhere about, General von Kluck had placed two bodies of cavalymen, each body containing about 9,000 men, as a precaution against a flank attack from Paris. But, with the help of air patrols, Sir John French was able to get their range. The unsuspecting cavalry were waiting for their infantry to throw back the Fifth French Army, when they might expect orders to pursue. But, while they waited these orders, suddenly the sunny western woods belched aflame. Shrapnel and case shot poured a steady stream with murderous effect, and both bodies of cavalry were thrown into confusion. Timed to the second, the British cavalry was then hurled upon the demoralized German cavalry, which fled in a rout. Their flight was quickly covered,

however, by General von Kluck's horse artillery, before whose withering fire the British cavalry gave way and wheeled to allow the infantry to creep forward in open order to the attack.

The British forces were rested, refreshed, well supplied with ammunition and in the highest spirits that the forward march had begun. The quiet advance through the shady forest of Cr cy had given no fatigue and the rout of the German cavalry was another encouraging sign. When, then, the word came for the infantry to advance, it was with a cheer that it did so, expecting to carry all before it. But, while General von Kluck had blundered, or some of the tacticians on the German side had given orders that proved unwise, because of the disposition of the British army, the command of the German right was not to be caught napping. The British infantry was repulsed, with heavy losses. A German counterattack was also repulsed and it was not until five o'clock in the evening that the German shelter trenches were carried by bayonet attack.

Though the fighting in the center had been stationary on this sixth of September, 1914, it had been desperate. D'Esp rey was facing the 150,000 men of Von Kluck's army, and the effect of the British attack on Von Kluck's flank had not yet been felt. He more than held his own, but at great cost. General Foch, with the Ninth Army, had a double problem, for he was wrestling with General von B low to hold the southern edge of the S zanne plateau, while General von Hausen's Saxon Army was trying to turn his right flank. A violent attack, which, for the space of over two hours seemed likely to succeed was launched by the Duke of W rttemberg against General Langle and the Fourth Army. The attack was repelled, but the French losses were proportionately great. There could be no denial that many such attacks could break through the line. General Sarrail's army, fighting a losing game, showed marvelous stubbornness and gameness, but even so, it could not resist being pushed south of Fort Troyon, itself unable to support the battering it might expect to receive when the German siege guns should be brought into place.

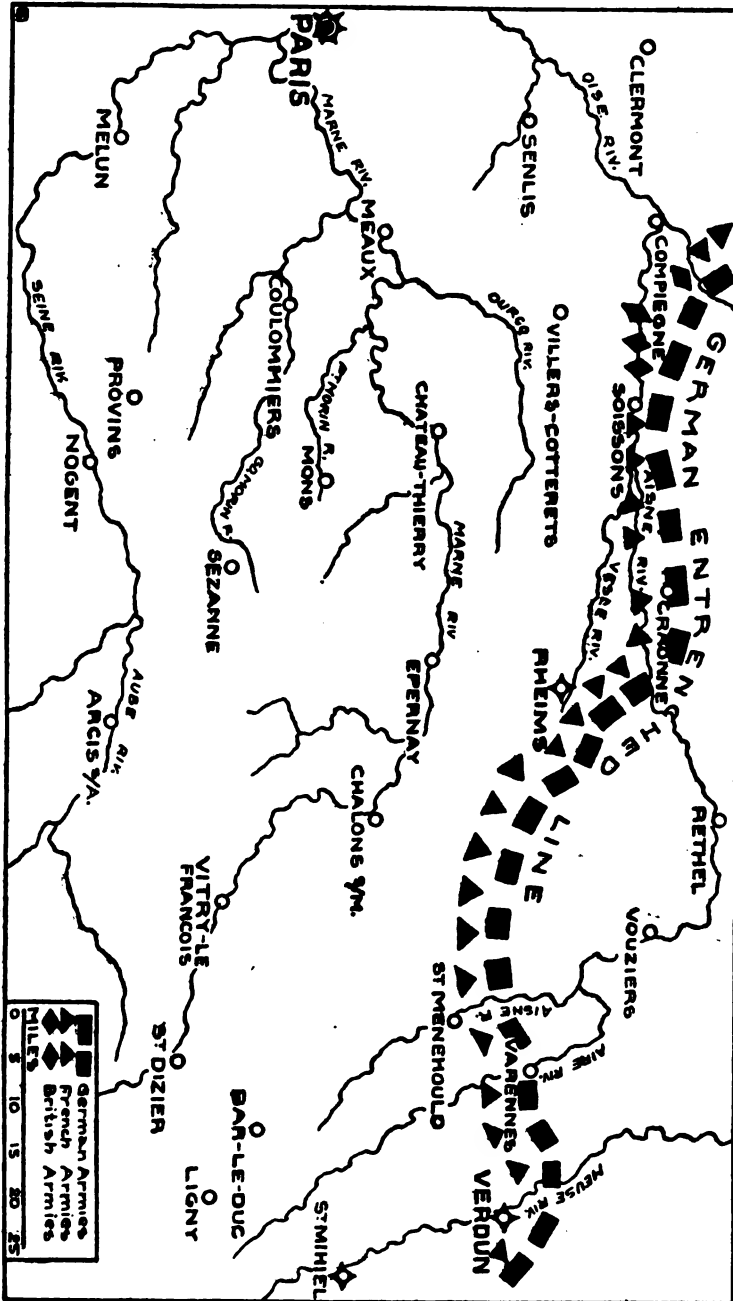

At every point but one, the Germans had a right to deem the

day successful. The only reversal had been a minor one before the forest of Cr  cy. Yet, of all the generals on that front Von Kluck alone was in a position to see the gravity of the situation. The British had caught him on the flank as he tried to pierce the left wing of General d'Esp  rey's army, and if he should now retreat, that army could circle on him and thus catch him between two fires.

Next morning, Monday, September 7, 1914, another glorious summer morning, saw a resumption of the battle along exactly the same lines, with the same persistent attack and defense along the eastern part of the front, and with the British making full use of the blunder made by the German right. General von Kluck had realized his plight, but even so he had not secured an understanding of the size of the force that was threatening his flank, and he sent as a reenforcement a single army corps which had been intrenched near Coulommiers on the Grand Morin. The British had three full army corps and were well supplied with cavalry and artillery. Yet Coulommiers was Von Kluck's headquarters and actually, when the Germans were driven back and the British troops entered the town, Prince Eitel, the second son of the Kaiser, General von Kluck and his staff were compelled to run down to their motor cars and escape at top speed along the road to Rebais, leaving their half-eaten breakfast on the table, and their glasses of wine half emptied. One of the most dramatic cavalry actions of this period of the war took place shortly before noon, when one hundred and seventeen squadrons of cavalry were engaged. In this action the British were successful, but the German cavalry were tired and harassed, having been severely handled the day before.

In this engagement between the British and the German right, all the odds had been in favor of the British, and success meant merely the grasping at opportunities that presented themselves. Still, by constantly striking at General von Kluck's exposed flank, his frontal attack of General d'Esp  rey was so weakened, that, toward evening at the close of two days of continuous and very severe fighting, the Fifth French Army was able to advance and hold the position from La Fert   Gaucher to Esternay. The

BATTLE OF THE MARNE--END OF GERMAN RETREAT AND THE INTRENCHED LINE ON THE AISNE RIVER

ground gained was valuable but not essential, yet it made a profound impression. General d'Espérey's step forward was the Germans' step back. It meant that the road to Paris was barred. How fully this was realized may be seen from an order signed by Lieutenant General Tuelff von Tschepe und Weidenbach and found in the house that had been occupied by the staff of the Eighth German Army Corps when the victorious French entered Vitry-le-François. The order was dated "September 7, 10:30 p. m." and it read as follows:

"The object of our long and arduous marches has been achieved. The principal French troops have been forced to accept battle, after having been continually forced back. The great decision is undoubtedly at hand. To-morrow, therefore, the whole strength of the German army, as well as all that of our Army Corps, are bound to be engaged all along the line from Paris to Verdun. To save the welfare and the honor of Germany I expect every officer and man, notwithstanding the hard and heroic fights of the last few days, to do his duty unswervingly and to the last breath. Everything depends on the result of to-morrow."

Much did, indeed, depend on the result of the morrow, and for the third day, again, it was General von Kluck's initial error that brought disaster to the German side. What caused it? There is not sufficient evidence to determine. It stands out, however, as the crucial blunder of the German drive, and it occurred just at the very limit of that drive, just at that point where a single weakness assumed extraordinary proportions. General von Kluck was afterward degraded for it. From the position of the foremost general intrusted with the honor of leading the very forefront of the advance on Paris, he became a commander of no special importance in an uncontested portion of the trenches. Yet on this September 8, 1914, and in the three days following, General von Kluck endeavored to retrieve his mistake with a retreat that was masterly, losing comparatively few men and leaving behind a much smaller number of guns and supplies than would have been thought possible with forces pressing him both on the flanks and rear.

CHAPTER XV

GERMAN RETREAT

THAT morning of the 8th, then, saw General von Kluck in full retreat. His frontal attack on General d'Espérey had failed and the Fifth French Army had advanced. The British were at his flank, and besides, they had been able to spare some of their heavy artillery to send to the Sixth Army under General Maunoury, to enable him to cross the Ourcq. It is by no means certain that even with this assistance, could the Sixth Army have silenced the terrible fire of those howitzers, but General von Kluck dared no longer leave his artillery there, it must be taken with him on his retreat, or become valuable booty. Leaving a few batteries to guard the crossings of the river, the Ourcq division of the German right retreated in good order, to rejoin their comrades who had been so unexpectedly mauled by the British. The honor of this day was, curiously, not to the victorious, but to the defeated army. Had General von Kluck done nothing other than conduct his army in retreat as he did, he would have shown himself an able commander. Sir John French and General d'Espérey followed up their advantage. The artillery fire of the British was good and in a running fight, such as this retreat, the light field artillery of the French did terrible execution. The brunt of the British fighting was at La Tretoire. General d'Espérey fought steadily forward all day, driving the retreating army as closely as he could, but proceeding warily because of General von Kluck's powerful counterattacks. The fighting was continuous from the first break of daylight until after dusk had fallen, and it was in the twilight that the French Army at last carried Montmirail on the Petit Morin, a feat of strategic value, since it exposed the right flank of Von Bülow's army, exposed by the retreat of General von Kluck.

From this review of the forced retirement of General von Kluck, it will be seen that the German right was compelled to sustain an attack at three points, from the Sixth French Army

on the banks of the Ourcq, from the British army in the region of Coulommiers and from the Fifth French Army near Courtaçon. Each of these attacks was of a widely different character. The result of this attack has been shown in the summary of the three days (four days on the Ourcq) which resulted in the British capture of Coulommiers and in the French capture of Montmirail. This was General Joffre's counteroffensive, and it developed in detail almost exactly along the lines that he had laid down.

The scene of the fighting across the west bank of the Ourcq was that of a wide-open country, gently undulating, dotted with comfortable farmhouses, and made up of a mosaic of green meadow lands and the stubble of grain fields. The German heavy guns came into action as soon as the French offensive developed. Tremendous detonations that shook the earth, and which were followed by sluggish clouds of an oily smoke showed where the high-explosive shells had struck. Already, by the evening of the first day's fighting, there were blazing haystacks and farmhouses to be seen, and the happy and smiling plain showed scarred and rent with the mangling hand of war. On the 6th, a sugar refinery, which had been held at an outpost by a force of 1,800 Germans was set on fire by a French battery. The infantry had been successful in getting to within close range and as the invaders sought to escape from the burning building, they were picked off one by one by the French marksmen. The French infantry, well intrenched, suffered scarcely any loss. It was in brilliant sunshine that the fire broke out, and the conflagration was so fierce that the empty building sent up little smoke. The flames scarcely showed in the bright light, and to the onlooker, it seemed as if some rapid leprous disease was eating up the building. The situation was horrible for the Germans, either to be trapped and to perish in the flames, or to face the withering French infantry fire without any opportunity to fight back. Less than 300 of the occupants of the refinery won clear.

Wherever the forces met, the slaughter was great and terrible. In the excitement and the eagerness of the first offensive, the

French seemed to have forgotten the lessons of prudence that the long retreat should have ingrained into their memory, and they sought to take every village that was occupied by the Germans with a rush. The loss of life was greatest at a point four miles east of Meaux. There, on a sharp, tree-covered ridge, the Germans had intrenched, and gun platforms had been placed under the screen of the trees. An almost incessant hail of shrapnel fell on these lines, and the French infantry charges were repulsed again and again, with but little loss on the German line. But, meantime, village after village had been attacked by the French and carried with the bayonet, and on Sunday, September 6th, 1914, that part of the Battles of the Marne which dealt with the driving back of the Germans to the line of the Ourcq, was in some of its feature like a hand-to-hand conflict of ages long gone by. Yet, overhead aeroplanes circled, on every side shells were bursting, the heavy smell of blood on a hot day mingled with the explosive fumes, but the Zouaves and the Turcos fought without ceasing and with a force and spirit that went far to win for the French the cheering news that village after village had been freed of the invaders.

When the night of that Sunday fell, however, on the line of the Ourcq, the balm of darkness seemed to be almost as much a forgotten thing as the blessedness of silence. There was no darkness that night. As the Germans evacuated each village they set fire to it. The invaders actually held their machine guns at work in the burning village until the position was no longer tenable. The wind blew gustily that night, and all the hours long, the Germans collected their dead, built great pyres of wood and straw and cremated their comrades who had fallen on the field of honor.

The next day, at this point, developed fighting of the same general character. One of the most heroic defenses of General von Kluck's army was that of the Magdeburg regiment, which held its advanced post ten minutes too long and consequently was practically annihilated. Although the French had everywhere shown themselves superior with the bayonet and at close infighting, even as the Germans had displayed an incredible

courage in advance under gunfire, and rightly held their heavy artillery to be the finest in the world, in the *melée* around the colors of the Magdeburg Regiment, there was nothing to choose for either side. The lieutenant color bearer was killed, in the midst of a ring of dead, and not until almost the whole regiment had been killed under the impact of far superior numbers, were the tattered colors taken into the French lines. It was on this day, Tuesday, September 8, 1914, that the British army realizing that it had turned the flank of General von Kluck's southern divisions sent its heavy batteries to the pressure on the banks of the Ourcq.

A graphic picture of the artillery side of the fighting on the Ourcq was given by one of the artillery officers detached from the British force.

"Meaux was still a town of blank shutters and empty streets when we got there this morning," he wrote, "but the French sappers had thrown a plank gangway across the gap in the ruined old bridge, built in A. D. 800, that had survived all the wars of France, only to perish at last in this one.

"Smack, smack, smack, smack go the French guns; and then, a few seconds later, four white mushrooms of smoke spring up over the far woods and slowly the pop, pop, pop, pop, of the distant explosions comes back to you. But now it is the German gunners' turn. Bang! go his guns, two miles away; there is a moment of eerie and uncomfortable silence—uncomfortable because there is just a chance they might have altered their range—and then, quite close by, over the wood where the battery is, come the crashes of the bursting shells. They sound like a Titan's blows on a gigantic kettle filled with tons of old iron.

"At Trilport there is a yawning gap, where one arch of the railway bridge used to be, with a solitary bent rail still lying across it. And, among the wreckage of the bridge below, lying on its side and more than half beneath the water, is the smashed and splintered ruin of a closed motor car.

"Beyond the town was a ridge on which the French batteries were posted. We could see the ammunition wagons parked on the reverse slope of the hill. More were moving up to join them.

"The village beyond, Penchard, was thronged with troops and blocked with ambulance wagons and ammunition carts.

"Through the rank grass at the side came tramping a long file of dusty, sweating, wearied men. They carried long spades and picks as well as their rifles. They had come out of the firing line and were going back to Penchard for food.

"Topping the next ridge . . . the hill slopes steeply down to the hamlet of Chamvery, just below us. The battery which I mentioned just now is in the wood on this side of it to our right. The Zouaves' firing line is lying flat on the hillside a little way beyond the village, and behind them, farther down the hill, are thick lines of supports in the cover of intrenchments. It is a spectacle entirely typical of a modern battle, for there is scarcely anything to see at all. If it were not for those shells being tossed to and fro on the right there, and an occasional splutter of rifle fire, one might easily suppose that the lines of blue-coated men lying about on the stubble were all dozing in the hot afternoon sun.

"Even when some of them move they seem to do it lazily, to saunter rather than to walk. . . . It is only in the cinematograph or on the comparatively rare occasions of close fighting at short range that men rush about dramatically. For one thing, they are too tired to hurry; and anyhow, what is the use of running when a shell may burst any minute anywhere in the square mile you happen to be on?

"I walked with the company officers who were planning a fresh advance, map in hand. They had gained the village in which we were that morning, but at tremendous loss.

"'Out of my company of 220,' said one captain, 'there are only 100 left. It's the same story everywhere—the German machine guns. Their fire simply clears the ground like a razor. You just can't understand how anyone gets away alive. I've had men fall at my right hand and my left. You can't look anywhere, as you advance, without seeing men dropping. Of our four officers, two are wounded and one dead. I am left alone in command.'"

This hand-to-hand fighting for the possession of villages on the west bank of the Marne, this heavy loss to the French troops by

the German artillery, and this sudden check at the Ourcq itself, until British heavy batteries were sent, marks the character of what may be called the battle of the Ourcq, the westernmost of the battles of the Marne. As General von Kluck had divided his forces, in order to carry out the attempt to pierce the left of General d'Espérey's army, the German forces in the battle of the Ourcq were outnumbered almost three to one. In spite of these odds against them, the extreme German right held for four days the position it had been given to hold.

CHAPTER XVI

SECOND BATTLE

REMEMBERING again the general outline of General von Kluck's plan, that of executing a diagonal movement with 150,000 of his men to attack the easternmost point of the Fifth Army, and possibly to envelop it by a flank movement, the second of the battles of the Marne may be treated with more detail. This is called the battle of Coulommiers.

In this battle there was as great a change in morale as had been shown in the battle of the Ourcq. There, the French had been stirred to high endeavor by the realization that the word to advance had at last been given. This also operated in part on the British in the battle of Coulommiers, but, in addition, there was another very important factor.

The dawn of that Sunday summer morning, September 6, 1914, was one of great exhilaration for the British forces. The offensive was begun, the time for striking back had come, and every column resounded with marching choruses. The countryside was lovely, as had been all the countryside through which the retreating armies had passed, gay with the little French homesteads, flower decked and smiling, heavily laden orchards, and rich grain fields, some as yet uncut, some newly stacked. Women and children, with here and there an old man, ran along

the line of march ministering to the wants of their defenders. There was no need for language, as courtesy and gratitude are universal, and the English were fighting for "La Belle France." So the morning wore on.

Through the forested region of Cr cy the British passed, and it has been told hereinbefore how they surprised the two cavalry commands thrust out as scouts by General von Kluck. But, as they reached the land that had been occupied by the German hosts, the bearing of the men changed, even as the country changed. The simple homes of the peasants were in ashes, every house that had showed traces of comfort had been sacked or gutted with fire. Between noon and three o'clock in the afternoon of that day three burned churches were passed. The songs stopped. A black silence fell upon the ranks. Bloody business was afoot.

It was in the middle of the afternoon, a slumbrous harvest afternoon, that a big gun boomed in the distance, and the shell shrieked dolefully through the air, its vicious whine ceasing with a tremendous sudden roar as it burst behind the advancing British lines. On the instant, Sir John French's batteries almost wiped out the German cavalry, and ten minutes had not elapsed before the full artillery on both sides had begun a terrific fire that was stunning to the senses. Under cover of their own fire, the British infantry advanced and hurled themselves against the outer line of General von Kluck's Second Army. The attack failed. The British were driven back, but though the loss of life was sharp, it was not great, as the British commander had but advanced his men to test out the invader's strength. The British artillery was well placed, and under its cover the British made a second advance, this time successful. The Germans replied with a counterattack which was repulsed, but in that forty minutes 10,000 men had fallen.

A dispatch has been quoted from a French soldier, showing the terrible havoc caused by the German machine guns, and a letter from a German officer, published in the "Intelligenzblatt" of Berne pays a like tribute to the artillery of the Allies. Speaking of this very section of the battle front, he wrote:

"We were obliged to retreat as the English were attempting a turning movement, which was discovered by our airmen. (This refers to the advance of the British First Army Corps under Sir Douglas Haig in the direction of La Ferté-sous-Jouarre, which, if it could have been successfully carried out, would have meant the entire loss of General von Kluck's southern army). During the last two hours we were continually exposed to the fire of the enemy's artillery, for our artillery had all either been put out of action or had retreated and had ceased to fire. (This dispatch was evidently, therefore, written toward the end of the second day, on Monday, September 6, 1914, when General von Kluck realized that his forward drive had failed and that he must fall back.)

"The enemy's airmen flew above us, describing two circles, which means, 'there is infantry here.' The enemy's artillery mowed the ground with its fire. In one minute's time I counted forty shells. The shrapnel exploded nearer and nearer; at last it reached our ranks. I quickly hugged a knapsack to my stomach in order to protect myself as best I could. The shrieks of the wounded rang out on all sides. Tears came to my eyes when I heard the poor devils moaning with pain. The dust, the smoke, and the stench of the powder were suffocating.

"An order rang out, and bending as low as possible, we started up. We had to pass right in the line of fire. The men began to fall like ninepins. God be thanked that I was able to run as I did. I thought my heart would burst, and was about to throw myself on the ground, unable to continue, when your image and that of Bolli rose before my eyes, and I ran on.

"At last we reached our batteries. Three guns were smashed to pieces, and the gun carriages were burned. We halted for a few seconds to take breath. And all the time that whistling and banging of the shells continued. It is a wonder one is not driven mad."

Admiration cannot be withheld from General von Kluck for his splendid fight at the battle of Coulommiers. He was out-generalled, for one thing, because of his plan—or his orders—to strike a southeasterly blow; he was outmaneuvered by the pres-

ence of a vastly larger British force than he had any reason to expect, and he was outnumbered almost two to one.

Through the apple and pear orchards of La Trétoire the battle was sanguinary, the British (reenforced on September 7, 1914, by some French divisions) swept through the terrain in widely extended lines, for close formation was not to be thought of with artillery and machine guns in front. It was bitter fighting, and the German right contested every inch of ground stubbornly. Once, indeed, it seemed that General von Kluck would turn the tables. He rapidly collected his retreating troops, and with unparalleled suddenness hurled them back upon the advancing First Corps under Sir Douglas Haig. Aeroplane scouts decided the issue. Had the British been compelled to await the onset, or had they been forced to depend on cavalry patrols, there would have been no opportunity to resist that revengeful onslaught. But the air was vibrant with the droning of the great air machines, and no sooner had the Germans begun to re-form, than Sir Douglas Haig moved his machine guns to the front and fell back a few hundred yards to a better position. This happened on September 8, 1914, and may be regarded as the last offensive move made by General von Kluck's army in the west. On that same day Coulommiers was invested and Prince Eitel compelled to flee, and the battle of Coulommiers was won.

CHAPTER XVII

THIRD BATTLE

THE third of the battles of the Marne, the battle of Montmirail, was not marked by special incident. General d'Espérey's part was to hold firm, and this he was well able to do. Not only by reason of the British assistance on the left, but also because the strong army of General Foch to the right was a new army, of greater strength than was known to General von Moltke and the German General Staff. The battle of Montmirail was won by the

steady resistance of the Fifth Army to the hammer blows of the German right, and to the quick advantage seized by General d'Espérey when the British weakened the flank of the force opposing him. On September 8, 1914, General d'Espérey had not only held his ground, but had driven General von Kluck back across the Grand Morin River at La Ferté-Gaucher, and also across the Petit Morin at Montmirail. Since the British had butted the Germans back from the Petit Morin at La Trétoire, these three days of fighting in the battles of Coulommiers and Montmirail had won the Allies advanced positions across two rivers, and at the same time had so weakened the German right that it was compelled to fall back on the main army and forego its important strategic advantage on the east bank of the Ourcq River.

These three battles, Ourcq, Coulommiers, and Montmirail, constitute the recoil from Paris, and at the same time they constitute the defeat of what was hereinbefore shown to be one of the four fundamentals of the great German campaign plan. With the situation thus cleared, so to speak, one may now pass to the details of the second part of the German plan, which was to engage the powerful Ninth and Fourth Armies, under the command of Generals Foch and Langle, respectively, to break through them, if possible, but at all hazards to keep them sufficiently menaced to disable General Joffre from sending reinforcements therefrom to the army of General Sarrail, on which the whole force of the army of the crown prince was to be hurled.

The next section of the allied armies, then, was General Foch's Ninth Army, which encountered the German drive at Fère Champenoise, and which resulted in the severe handling of General von Bülow's forces. With characteristic perception of the difference between a greater and a lesser encounter, General Foch called his share of the battles of the Marne, the "Affair of the Marshes of St. Gond." This did not culminate until Wednesday, September 9, 1914, so that the German retreat there was one day later than the final retreat of General von Kluck.

The clash between the armies of General von Bülow and of General Foch began, as did the battle wrath along the whole front, at dawn of that fateful Sunday, September 5, 1914. Gen-

eral Foch, one of the greatest living authorities on military strategy, had devised his army for defense. He was well supplied with the famous 75-mm. guns, holding them massed in the center of his line. His extreme right and left were mobile and thrown partly forward to feel the attack of the invading army. But, in spite of all preparations, General Foch found himself hard-set to hold his own on September 5, 6, 7, and 8, 1914. The battle continued incessantly, by night as well as by day, for the artilleryists had found each other's range. There was comparatively little hand-to-hand fighting at this point, General Foch only once being successful in luring the Germans to within close firing range. The results were withering, and General von Bülow did not attempt it a second time. There seems reason to believe that General von Bülow had counted upon acting as a reserve force to General von Kluck in the circling plan of the latter, and that, consequently, he did not think it tactical to risk heavy loss of life until he knew the situation to westward of him. There was some sharp grenade work at Fère Champenoise on September 8, and then came the night of the 8th.

It will be remembered that at the close of the battle of Montmirail on the evening of September 8, 1914, the western flank of Von Bülow's army had been exposed by the advance of General d'Espérey and the retreat of General von Kluck. Information of this reached Foch, and despite the danger of the maneuver, he thrust out his mobile left like a great tongue. That night the weather turned stormy, facilitating this move. At one o'clock in the morning, the statement has been made, word reached General Foch indirectly, that air patrols had observed a gap in the alignment of the German armies between General von Bülow's left and General von Hausen's right.

During the darkness and the rain, therefore, General Foch had worked two complete surprises on General von Bülow. He had enveloped the German commander's right flank, and was safely ensconced there with General d'Espérey's army behind him, since the latter had by now advanced to Montmirail. At the same time he had thrust a wedge between Von Bülow and General von Hausen, threatening General von Bülow's left flank as well. The

first was a sound tactical seizure of an opportunity, executed with military promptness, the second was a bold *coup*, and its risk might well have appalled a less experienced tactician.

Considering the westernmost of these movements first, it will be seen at once how the enveloping action brought about the "Affair of the Marshes of St. Gond." General von Bülow's army was stretched in an arc around the marshes, which, it will be remembered, have been described as a pocket of clay, low-lying lands mainly reclaimed, but which become miry during heavy rains. It was General von Bülow's misfortune, that, on the very night that his flank was exposed, there should come a torrential downpour. These same marshes had figured more than once before in France's military history, and General Foch, as a master strategist, was determined that they should serve again. When the rain came, he thanked his lucky stars and acted on the instant.

When the morning of September 9, 1914, dawned, the left wing of General Foch's army was not only covering the exposed flank of General von Bülow's forces, but parts of it were two miles to the rear. Under the driving rain, morning broke slowly, and almost before a sodden and rain-soaked world could awake to the fact that day had come, General Foch had nipped the rear of the flank of the opposing army, and was bending the arc in upon itself. Under normal circumstances, such an action would tend but to strengthen the army thus attacked, since it brings all parts of the army into closer communication. But General Foch knew that the disadvantages of the ground would more than compensate for this, since the two horns of General von Bülow's army could not combine without crossing those marshes, now boggy enough, and growing boggier every second. The task was harder than General Foch anticipated, for the same rainy conditions that provided a pitfall for the Germans were also a manifest hindrance to the rapid execution of military maneuvers. But, in spite of all difficulties, by evening of that day, the flank broke and gave way, and two entire corps from General von Bülow's right were precipitated into the marshes. Forty guns were taken—to that time the largest capture of artillery made by the Allies—and a number of prisoners. Hundreds perished miserably, but

General Foch held back his artillery from an indiscriminate slaughter of men made helpless in the slimy mud. Thus ended the "Affair of the Marshes of St. Gond," which broke still further the German right wing.

Thanks to General Foch's further activities, General von Bülow had troubles upon his left wing. When dawn of this same day of torrential rain, September 9, 1914, broke over the hill-road that runs from Mareuil to Fère-Champenoise, at which point lay the left of General von Bülow's army, it witnessed a number of 75-mm. guns on selected gun sites commanding the western flank of the German right center. General Foch's daring, the success of the maneuver, and the fact that the conduct of all the French armies on that day and the day following seems to be with the full cognizance of this venture, led inevitably to the conclusion that it was more than a brilliant feat conceived in the dead of night by a single general. It bears the stamp of being a movement well expected by the French General Staff, and possibly planned by General Joffre himself. Had General Foch been less ably supported, his wedge might have proved a weak salient open to attack on both sides. But General Foch's main army to the west kept General von Bülow busy, and General Langle's army to the east fought too stubbornly for the Duke of Württemberg to dare detach any forces for the relief of General von Bülow. General von Hausen's Saxon Army was weak, at best.

What were the forces that operated to make this particular point so weak are not generally known. As, however, the divisions from Alsace were much in evidence three or four days later, it is more than probable that these divisions were intended for service at this point, and also to reenforce General von Kluck's army, but that, by the quick offensive assumed by General Joffre on the Ourcq, and, owing to the roundabout nature of the German means of communication, these expected reinforcements had not arrived. The German official dispatches point out that General von Bülow's retreat was necessitated by the retreat of General von Kluck. Of this there is no doubt, but even military necessity does not quite explain why General von Bülow bolted

so precipitately. His losses were fearful, and the strategy of General Foch rendered it necessary for the Germans to fall back on the Aisne.

The armies of the Duke of Württemberg and of the crown prince may be considered together, for they were combined in an effort to pierce the French line near the angle at Bar-le-Duc. General Langle held on desperately against the repeated attacks of the Duke of Württemberg. Ground was lost and recovered, lost again and recovered, and every trifling vantage point of ground was fought for with a bitter intensity. Though active, with all the other armies, on September 5 and 6, 1914, it was not until September 7 that General Langle found himself strained to his utmost nerve. If he could hold, he could do no more, and when night fell on September 7, no person was more relieved than General Langle. Yet the next day was even worse. Instead of slackening in the evil weather, the German drive became more furious. The exhausted Fourth Army fought as though in a hideous nightmare, defended their lines in a sullen obstinacy that seemed almost stuporous, and countercharged in a blind frenzy that approached to delirium. It was doubtful if General Langle's army could hold out much longer. But, when General von Bülow was compelled to retreat, when General Foch turned his attention to General von Hausen's Saxon Army, and when General Joffre found himself in a position to rush reinforcements and reserves to the aid of General Langle, a new color was given to the affair. The defense stiffened, and as rapidly as it stiffened, so much the more did it become patent that the Duke of Württemberg could not afford to be in an exposed position far in advance of all the other attacking armies. Wednesday, September 9, 1914, revealed to the German center the need of falling back on the crown prince's army, which was the pivot on which the whole campaign swung.

Meantime, the crown prince's army had been steadily victorious. The weak French army under General Sarrail had been pushed back, yielding only foot by foot, back, back, along the rugged hill country of the Meuse. A determined stand was made to protect the little fort of Troyon, ten miles south of Verdun, for

had the Germans succeeded in taking this, Verdun would have been surrounded. No army and no generalship could have done more than the Third Army and General Sarrail did, but they could not hold their ground before Troyon. On September 7, 1914, the way to Troyon was open, and the army of the crown prince prepared to demolish it. Then came September 9, 1914, when the allied successes in the western part of the Marne valley allowed them to send reinforcements. Thus the Third Army was perceptibly strengthened and hope for Troyon grew. One day more, certainly two days more, and nothing could have saved Troyon, but with the whole German line in retreat, the army of the crown prince could not be left on the advance.

Incredible though it may seem, when the army of the crown prince besieging Troyon withdrew, that little fort was a mere heap of ruins. There were exactly forty-four men left in the fort and four serviceable guns. Even a small storming party could have carried it without the least trouble, and its natural strength could have been fortified in such wise as to make it a pivotal point from which to harry Verdun.

At the extreme east, on that ring of wooded heights known as the Grande Couronne de Nancy, and drawn up across the Gap of Nancy, the Second French Army, under General de Castelnau, successfully resisted the drive of the Crown Prince of Bavaria. Great hopes had been placed on this attack, and on September 7, 1914, the German Emperor had viewed the fight at Nancy from one of the neighboring heights. Surely a victory for the German arms might come either at the point where stood the German Emperor or where led the crown prince. But the fortunes of war decided otherwise. Far from losing at Nancy, the French took the offensive. After an artillery duel of terrific magnitude, they drove the Bavarian army from the forests of Champenous and took Amance. The line of the Meurthe was then found untenable by the Germans, and on September 12, 1914, General de Castelnau reoccupied the town of Luneville, which had been in the hands of the Germans since August 22, 1914.

With General von Kluck in retreat on September 7, 1914, General von Bülow hastening to the rear on September 8, 1914, with

the Duke of Württemberg falling back on September 9, 1914, and the Imperial Crown Prince and the Bavarian Crown Prince retreating to an inner ring of defense on September 10, 1914, the battles of the Marne may, in a measure, be said to have concluded. As, however, the new alignments were made mainly by reason of the topographical relationships of the Marne and the Aisne Rivers and the territory contiguous thereto, it is perhaps more in keeping with the movement to carry forward the German retreat across the Marne as a part of the same group of conflicts.

CHAPTER XVIII

SUMMARY OF BATTLE OF THE MARNE

STRICTLY speaking, the German retreat occupied the days of September 8, 9, 10, 11, 1914. The retreats of the 8th and 9th were those of General von Kluck and General von Bülow, and these have been dealt with in detail. On Thursday, September 10, 1914, the German opposition was over and the retreat became a drive. Yet, in spite of the unexpected defeat, in spite of the miry ground and the disadvantageous weather, the German retirement was carried out in splendid order. It might have been a rout, but it was nothing of the kind, and every effort made by the Allied armies to follow up their advantage was checked by rear-guard attacks. An excellent account of one such action shows how a division was held up for an entire day by one of these rear-guard actions. It is dated September 10, and evidently deals with the advance on the Marne River. It reads:

"The other day, Thursday, we, a battery of the — Division, were marching along the road toward the — River. The day before there had been a small advance-guard action, and we were expecting a peaceful march. However, as we neared the river, the battery was ordered to trot, and I guessed something was on. Soon we passed through a small village, and saw some dead and wounded lying about; also we heard the rattle of Maxims. The

major had ridden on with me and showed me where the battery was to come into action. I sent back word and selected a position, which was soon taken up. We fired a few rounds, and very shortly after I was ordered to take my section on down the hill toward the river. Well, I found that the road was blocked by a section of another battery. I stopped my section and tried to find out the situation.

"The Germans were holding the opposite bank, a very steep bluff, with a battalion of the Jaegers and eight machine guns. The guns were trained on the road where it was fully exposed for about one hundred yards and nothing could cross. The section of the other battery was trying to locate them and break them out. So I took my section up the hill behind these and waited for any targets to appear. The advance guard had been working well. By taking cover of the woods they had managed to get down into the river bed and round the flanks. From there they opened a hot fire on the German machine guns.

"From my position I could see a portion of the road on the opposite bank. I had just got the range to this when a machine gun came galloping up. I fired two rounds at it. The first was over and just behind; the second was short. However, I had never seen anything move quicker than that gun. By now our infantry had forced the Jaegers back, and we had orders for a general advance. As we crossed the bridge I heard that seven of their machine guns had been captured. We wound up and up, and on all sides saw evidences of our fire. In one place an ammunition wagon had been hit, and both horses were blown over into the ditch. A bit higher up was a young boy hit in the back. All that we could do was to give him water. He told me that his orders had been to stay there until shot or captured. These German infantry are a brave lot.

"Well, we went on into the village at the top of the hill and came into action again. Our job there was to shell retiring infantry. We soon got a target and started away. Everything was working like a well-oiled machine. Suddenly I saw spurts of dust in and about my section, and also heard the unpleasant noise of Mauser bullets round my head. Some one was firing

at my section from a wood 150 yards on the right front. I promptly switched my two guns half right and fired at 300 yards into the wood. Also our spare gunners turned up with rifles and fired. After about five rounds, out came three Germans. However, they were very much more frightened than I, and put their hands up. Soon after about eight more came out. I interrogated them, and they said that they were lost and had been wandering for two days.

"While this excitement was going on, the other two sections had also been busy, one firing at German infantry and one at a German battery. The total capture for that day for us was 300 Germans and seven guns. Not bad for advanced-guard action. Still they had held up our division for a day, and done their work well and bravely."

All that day, Thursday, September 10, 1914, the forward advance continued, punctuated at every point by such actions. The British army struck across the Marne in the morning, and by evening stretched in echelon from Château-Thierry to La Ferté sous Jouarre. When dusk fell General Foch was almost at Chalons, and General Langle was encamped in Vitry after a very swift engagement with the rear guard of the Duke of Württemberg. The French success in that action had been decisive, and the rear guard fled in considerable disorder.

The next day, Friday, September 11, 1914, the French Sixth Army, under General Manoury, marched to an advanced position. It marched north by west toward Compiègne. On the same day the British drove forward across the upper reaches of the Ourcq and halted for the night in the valley of the Aisne, south of a line drawn between Soissons and Couvrelles. Chalons was entered by General Foch that day, and the famous battle field of Valmy formed the camping ground of General Langle's armies.

On Saturday, September 12, the whole of the German retreat to the line of the Aisne was consummated. The advance upon Paris was checked. The whole region of the Marne was in the hands of the Allies. The German retreat was as ably handled as the Allies' retreat had been, with this conspicuous difference, that the retreat of an attacking army signifies failure of a plan,

whereas the retreat of a defending army may well be the fulfillment of a plan. The battles of the Marne were the crucial point in Germany's invasive campaign, and the breakage of this plan hinged upon the mistake of General von Kluck and upon the strategy of Generals Joffre and Foch.

The battles of the Marne thrust themselves in the forefront of the great westward German drive almost with the insistence of attention that do some of the decisive battles of the world, as, for example, that of Tours, when Charles Martel drove back the Saracens from France. But there is danger in such emphasis, for the several battles of the Marne were by no means a decisive victory for the Allies. They were only a decisive check, and, what was more, they were a check only in so far as they drove back the invading hosts to a line of defenses of marvelous strength and defensibility. The Allies were in no position to say: "Thus far shall you come and no further!" All that the battles of the Marne entitled them to say was: "This one step farther you cannot hold!"

John Buchan, writing on the battle of the Aisne, makes a point of great pith and moment when he points out that in the battle of the Marne the Allies were able to snatch the initiative from the Central Powers, but that in the battle of the Aisne the Germans retained the initiative—"they compelled their adversaries to adopt the form of battle on which they had decided: a trench battle, well suited to their own mechanical genius. A war of intrenchments began which was to last for many weary months, and which can only be paralleled from the annals of medieval contests."

More than this, however, the German plan of campaign which had failed to achieve success in the drive for Paris had not been the only plan of campaign. Nothing is more significant of Germany's perception of the possible difficulties to be encountered in reducing Paris than the marvelously strong line of defenses the General Staff had prepared behind its drive, a line of defense intended for machinery. Germany did more than take the initiative in position at the battle of the Aisne, she did more than determine the manner in which all engagements must be fought:

she deliberately and with consummate strategy determined that the contest should be between flesh and blood on the one side and death-dealing machinery on the other. Her artillery was at that time the most efficient in the world, her mobilization of ammunition supplies was no less marvelously handled than her mobilization of men, and every foot of that country had been studied years before by Germany, so that, when the time came to fortify the Soissons plateau, there was scarcely any need for reconnoitering; each gun had its little spot assigned to it and could be placed thither without delay. A trench fortress "made while you wait" was the chief factor in the battle of the crossing of the Aisne.

CHAPTER XIX

"CROSSING THE AISNE"

IN order to gain a clear idea of what was involved in the feat of "crossing the Aisne," which more than one expert has declared to be the greatest military feat in river crossing in the history of arms, it is well to look at the topography of that point, first in its relation to the whole German line, and, second, in its relation to possible attack in September, 1914.

Strategists have said that from the Ural Mountains to the Atlantic Ocean there is no natural line so strong as the line occupied by the Germans. The line extends from a point north of Verdun, on the heights of the Meuse, across the wooded country of the Argonne and the plain of Champagne to Rheims, thence northwest to Brimont, crossing the Aisne near its confluence with the Suippe, and from thence proceeding to Craonne, whence it takes a westerly course along the heights of the Aisne to the Forest of the Eagle, north of Compiègne. The eastern end of this line has already been described in connection with the battles of the Marne, and it is the western section of this line which now demands consideration. Just as the River Marne was taken as a basis for the consideration of the topography of the battles

that centered round the crossing of the Ourcq, Grand Morin, Petit Morin, and the Marne, so the Aisne is naturally the most important determinant in the problems of its crossing.

The River Aisne rises in the Argonne, southwest of Verdun. Through the Champagne region its banks are of gradual slope, but shortly after it passes Rethel, on its westerly course, the configuration changes sharply, and at Craonne the bluffs overlooking the river are 450 feet high. It is easy to see what an inaccessible barrier is made by such a line of cliffs. For forty miles this line of bluffs continues, almost reaching to Compiègne, where the Aisne enters the Oise. Not only are the banks of the Aisne thus guarded by steep bluffs, but the character of those bluffs is peculiarly fitted for military purposes. For long stretches along the north side the cliffs stand sheer and have spurs that dip down sharply to the valley. The ridge, or the top of the bluff, which looks from below like the scarp of a great plateau, lies at an average of a mile or more from the stream. Many of these spurs jut out in such a way that if fortified they could enfilade up and down stream. To add to the military value of such a barrier the edge of the scarp is heavily wooded, while the lower slopes are steep and grassy, with small woods at irregular intervals. Even from the high ground on the south bank of the stream, the top of the plateau on the north cannot be seen, and from below it is effectually cloaked.

Two tributaries are to be considered in this river valley which thus forms so natural a post of defense. Both flow in from the south, the Suippe, which joins the main stream at Neufchâtel-sur-Aisne and the Vesle, on which stands the ancient city of Rheims. This river joins the Aisne a little over seven miles east of Soissons, which is itself twenty miles east of Compiègne.

The line taken by the German armies for their stand was not the river itself, but the northern ridge. At no place more than a mile and a half from the river, it was always within gunfire of any crossing. Every place of crossing was commanded by a spur. Every road on the north bank was in their hands, every road on the south bank curved upward so as to be a fair mark for their artillery. As the German drive advanced, a huge body

of sappers and miners had been left behind to fortify this Aisne line, and the system developed was much the same along its entire distance.

There were two lines of barbed-wire entanglements, one in the bed of the stream which would prevent fording or swimming, and which, being under water, could not easily be destroyed by gunfire from the southern bank. Above this was a heavy chevaux-de-frise and barbed-wire entanglement, partly sunk and concealed from view; in many places pitted and covered with brushwood. Above this, following approximately a thirty-foot contour, came a line of trenches for infantry, and fifty yards behind a second line of trenches, commanding a further elevation of fifty feet. Two-thirds of the way up the hill came the trench-living quarters, the kitchens, the bakeries, the dormitories, and so forth, and the crest of the hill bristled along its entire length with field guns, effectually screened by trees. On the further side of the ridge, in chalk pits, were the great howitzers, tossing their huge shells over the ridge and its defenses into the river itself, and even on the south bank beyond. Truly, a position of power, and one that the boldest of troops might hesitate to attack.

It is quite possible that had the entire strength of the German position been known, no attempt to cross would have been made, but there was always a possibility that the counterchecks of the German army were no more than the rear-guard actions of the three or four days immediately preceding. Yet Sir John French seems to have expected the true state of affairs, for he remarks in his dispatches:

"The battles of the Marne, which lasted from the morning of the 6th to the evening of the 10th, had hardly ended in the precipitate flight of the enemy when we were brought face to face with a position of extraordinary strength, carefully intrenched and prepared for defense by an army and staff which are thorough adepts in such work."

Yet it was evident that if the armies of the Allies were to secure any lasting benefit from the battles of the Marne, they must dislodge the invading hosts from their new vantage ground.

It was obvious that the task was one of great peril and one necessarily likely to be attended with heavy loss of life. Sir John French, knowing the tactical value of driving a fleeing army hard, determined on forcing the issue without delay.

Before proceeding to recount in detail the events of that six days' battle of the Aisne, which little by little solidified into an impassé, it might be well to trace the new positions that had been taken by the respective armies engaged in the struggle for the supremacy of western Europe. General von Kluck, still in charge of the First German Army, was in control of the western section from the Forest of the Eagle to the plateau of Craonne. He had forced his men to almost superhuman efforts, and by midnight of September 11 he had succeeded in getting most of his artillery across the Aisne, at Soissons, and had whipped his infantry into place on the heights north of the stream. That, with his exhausted troops, he succeeded remains still a tribute to his power as a commander. But the men were done. Further attack meant rout. His salvation lay in his heavy field guns and howitzers, an arm of the service in which the French army, under General Maunoury (and General Pau, who had taken a superior command during the turning of the German drive at the Marne), was notoriously weak. Still there was little comfort there, for the British army was well supplied with heavy artillery, and the Fifth French Army of General d'Espérey, also coming up to confront him, was not entirely lacking in this branch of the service.

General von Bülow's army was combined with that of General von Hausen, who fell ill and was retired from his command. Against this combined army was ranged the victorious and still fresh army of General Foch, lacking two corps, which had been detached for reserves elsewhere. One of these corps apparently went to the aid of General Sarrail, whose stand was still a weak point in the Allies' line. General Sarrail, however, was now better supported by the movement of General Langle with the Fourth French Army, who advanced toward Troyon and confronted the combined armies of the Imperial Crown Prince and the Duke of Württemberg. This released General Sarrail to his

task of intrenching and enlarging the defenses about Verdun, the importance of which had become more poignant than ever before in the events of the past week. The far eastern end of the line remained unchanged.

The credit for the crossing of the Aisne lies with the British troops. The battles of the Marne had thrust Sir John French into a prominent position, wherein he was able to achieve a much-desired result without any great loss of life. But the battle of the Aisne was different. It was a magnificent effort boldly carried out, and, as was afterward learned, it could not have been successful had the onset been delayed even one day.

General Maunoury's army, encamped in the forest of the Compiègne, was again the first to give battle, as it had been in the battles of the Marne. Using some heavy guns that had been sent on from Paris, in addition to the batteries that had been lent him by the British, he secured some well-planned artillery positions on the south bank, and spent the morning in a long-range duel with the German gunners near Soissons. The Germans had not all taken up their positions on the north side of the Aisne on the morning of September 12, 1914, and the heavy battery of the Fourth British Division did good service early in the morning, dislodging some of these before it wheeled in line beside the big French guns, in an endeavor to shell the trenches and level the barbed-wire entanglements, that an opportunity might be made to cross. But the results were not encouraging of success, for the reply from the further shore was terrific. General von Kluck's army might be worn out, but the iron throats of his guns were untiring, and he knew that huge reinforcements were on the way.

CHAPTER XX

FIRST DAY'S BATTLES

THAT first day of the battle of the Aisne, September 12, 1914, which was indeed rather preparatory than actual, was also marked by some unusually brilliant cavalry work in General Allenby's division. The German line was on the farther side of the Aisne, but all the hill country between the Marne and the Aisne had to be cleared of the powerful rear guards of the retreating German army, or perhaps it would be more correct to say the advance guards of the new German line. Early in the morning the cavalry under General Allenby swept out from the town of Braisne on the Vesle and harried in every direction the strong detachments that had been sent forward, driving them back to the Aisne. Over the high wooded ridge between the Vesle and the Aisne the Germans were driven back, and the Third Division, under General Hamilton, supported the cavalry in force, so that, by the evening, General Hamilton's division was able to camp below the hill of Brenelle, and even, before night fell, to get their guns upon that height, from which they could reply to the German batteries snugly ensconced upon the frowning ridge on the northern bank of the Aisne.

The Fifth British Division, under Sir Charles Fergusson, found itself in a tight place at the confluence of the Vesle and Aisne Rivers, for at that point lay a stretch of flat bottomland exposed to the German fire. By a ruse, which returned upon their own heads, the Germans had preserved one bridge across the Aisne, the bridge at Condé. This was done as a lure to Sir Charles Fergusson's forces, but even more so it was intended as a sallying point as soon as the German army deemed itself in a position to attack again. The bridge was destined to figure in the events of the great conflict when the grapple should come.

One of the most graphic of all the accounts of the fighting of that day was from the pen of a major in the British fieldartil-

lery, and it presented in sharp and vivid colors how the field artillery joined with the cavalry in clearing the German troops from the hills between the Marne and the Aisne. He wrote:

"We got the order to go off and join a battery under Colonel ——'s orders. We came en route under heavy shrapnel fire on the road. I gave the order to walk, as the horses had hardly had any food for a couple of days, and also I wanted to steady the show. I can't say I enjoyed walking along at the head with old —— behind me, especially when six shrapnel burst right in front of us. We got there just in time, rushed into action, and opened fire on a German counterattack at short range, destroying the lot so far as I could see.

"We then moved slightly to another position to take on a valley, down which they were attacking, and were at it the whole day, firing about 900 rounds into quantities of German attacks and counterattacks. They cannot stand the shrapnel, and the moment I got one on them they turned and bolted back to the wood.

"I got on to their trenches; one shell dropped in. [It would appear from this that some of the advance guards of the new defense line were either intrenching or occupying trenches made during the battles of the Marne, probably the latter, or else the writer is speaking of the actions of his battery on the 10th as well as the 12th before the invaders had retreated across the Marne.] I was enfilading them, and they tore out of the trenches, and so on, each trench in turn, and fell in hundreds. Also, through the range finder, —— saw I'd hit a machine gun, and they had abandoned it and another. So it went all day, shells and bullets humming around, but only one of my staff horses was hit. Our infantry advancing and retiring—others advancing and coming back—Germans doing likewise, a hellish din of shell fire, and me pouring in fire whenever I could see them.

"At last I got six shrapnel into a wood and cleared a heap of them out and got into them with shrapnel. It was awful! The sergeant major put his hand up to his head and said: "Oh, sir, it's terrible!" That seemed to settle them, and at last we saw the infantry advancing to their positions without resistance.

"Now was my chance. I determined to get those machine guns if I could, as otherwise the infantry would. So I left — in command and got the trumpeter, sergeant major, and six men with six rifles, and went forward 'to reconnoiter,' as I reported to — after I had gone. It was a weird ride, through thick black woods, holding my revolver ready, going in front with the little trumpeter behind and the others following some way in the rear. We passed some very bad sights, and knew the woods were full of Germans who were afraid to get away on account of the dreaded shell fire. We got in front of our infantry, who were going to fire at us, but I shouted just in time.

"At last we came to the edge of a wood, and in front of us, about 200 yards away, was a little cup-shaped copse, and the enemy's trenches with machine guns a little farther on. I felt sure this wood was full of Germans, as I had seen them go in earlier. I started to gallop for it, and the others followed. Suddenly about fifty Germans bolted out, firing at us. I loosed off my revolver as fast as I could, and — loosed off his rifle from the saddle. They must have thought we were a regiment of cavalry, for, except for a few, they suddenly yelled and bolted. I stopped and dismounted my lot to fire at them, to make sure that they didn't change their minds.

"I waited for a lull, and mounted all my lot behind the bushes and made them spring as I gave the word to gallop for cover to the woods where the Welsh company was. There I got —, who understands them (the guns), and an infantryman who volunteered to help, and — and I ran up to the Maxims and took out the breech mechanism of both and one of the belts, and carried away one whole Maxim. We couldn't manage the other.

"We got back very slowly on account of the gun, and the men went wild with excitement that we had got one gun complete and the mechanism and belt of the other."

With such incidents the pursuit of the Germans across the Marne and to the Aisne was replete, and so thoroughly did the advance French and English troops scour that country that when the morning of September 13, 1914, dawned there was scarcely

a German soldier left on the southern side of the Aisne, west of Rheims.

The administration of the German armies meanwhile had been markedly changed. In the turning movement on the Marne the plan was clearly outlined, each commander had his instructions, and that was all. But with the need for changes of plan there was need for a directing head, and Field Marshal von Heeringen was sent in a hurry to take charge of the Aisne. This placed both General von Kluck and General von Bülow into subordinate positions. Field Marshal von Heeringen held a deserved reputation as one of the most brilliant as well as one of the most iron-willed of the German military leaders. He had been the backbone of the crown prince's movement against Troyon, a movement which, given a day or two longer, might have meant the capture of Verdun.

This was not the only factor that was framing up to give the German armies a decided advantage. The essential factor of the Aisne was the arrival of General von Zwehl and his guns. On September 13, 1914, at 6 a. m., Zwehl arrived in Laon, and in less than an hour he was in action on the Aisne front. The story of General von Zwehl and his guns is essential to an understanding of the causes that rendered the British victory of the Aisne a barren and a fruitless victory at best.

The week of September 5-12, 1914, witnessed the entire series of the battles of the Marne, which drove the Germans across the Marne and across the Aisne, as well as a German victory which exerted almost as powerful an influence in favor of the invaders as the check at the Marne did for the defenders. This victory was the fall of Maubeuge. It is going too far to say—as several writers on strategy have done—that General von Zwehl saved Germany, and that unless he had arrived as opportunely as he did the “German retreat to the Aisne valley would have been changed into a disastrous and overwhelming rout.” But it is not going too far to say that the successful holding of the Aisne line was due to the victor of Maubeuge.

General von Zwehl was one of the iron-jawed battle-scarred warriors of 1870, a man with a will as metallic as his own siege

guns, and a man who could no more be deflected from his purpose than a shell could be diverted in its flight. He had been set to reduce Maubeuge and he had done so with speed and with thoroughness. Maubeuge was not protected by open-air earthworks, but by a circle of armor-plate concrete forts. To the mighty siege guns handled by General von Zwehl, these were no trouble, for Von Zwehl had not only the heavy batteries attached to the Seventh Army Reserve, but he also had a number of Von Kluck's guns and the majority of General von Bülow's, neither of whom was expected to need siege guns in the forward drive where mobility was an essential. In addition to this, General von Zwehl also had the great siege train that had been prepared for the reduction of Paris. What chance had Maubeuge against such a potency?

On September 8, 1914, word reached General von Zwehl that the forward drive had failed, that the main armies had been beaten back and that he was to bring up his guns as rapidly as possible to cover the retreat. As rapidly as he could, to General von Zwehl, meant but one thing—to get there! He collected 9,000 reserve troops, which was almost immediately swelled by another 9,000, and with a total of 18,000 troops he started his siege trains for the town of Laon, where Field Marshal von Heeringen had taken up his headquarters. The weather turned bad, rendering the heavy guns extremely difficult to handle, but there could be no delay, no explanations, to General von Zwehl. If a gun was to be brought it was to be brought and that was all about it! Four days and three nights of almost continuous marching is killing. The German commander cared nothing for that. The guns must be kept moving. Could he get them there on time? In the last twenty-four hours of the march, his 18,000 troops covered 41 miles and they arrived in Laon at six o'clock in the morning of September 13, 1914, and were in action an hour later. The problem, therefore, before the English and French at the Aisne, was not the carrying of the river against a disheartened and retreating army, but the carrying of the river against a well-thought-out and forceful plan—a plan, moreover, backed up by the most powerful artillery that the world has ever seen.

CHAPTER XXI

THE BRITISH AT THE AISNE

IN the battles of the Marne, the brunt of the fighting had been borne mainly by the French armies, but the major part of work of the battle of the Aisne was borne by the British Expeditionary Force. Sir John French wasted no time. Saturday night, September 12, 1914, was a night of labor for engineers and gunners. The bridge trains belonging to the First and Second Army Corps were ordered to the edge of the river at daybreak, and as soon as the first gleam of dawn appeared in the sky, the heroic effort began.

At the risk of seeming a little detailed, in order to understand the somewhat involved maneuvers by which the British won the crossing of the Aisne, instead of dealing with the advance of the British army as a unit, in the manner that was done in discussing the battles of the Marne, their activities will be shown as army corps: the Third Army Corps to the westward, under General Pulteney; the Second Army Corps, under Sir Horace Smith-Dorrien, and the First Army Corps to the eastward, under Sir Douglas Haig, all, of course, under the general direction of Sir John French.

The British had no means of knowing what was in front of them. There was only one way to find out—a way, alas, often costly, a way that in every campaign costs thousands of lives apparently fruitlessly, and that is a frontal attack. Down over the slopes of the southern bank, into the bright, smiling river valley, where the little white villages in the distance were hiding their dilapidated state, marched the British army. Not a sign of activity showed itself upon the farther shore. A summer haze obscured objects at a distance, but, shortly before nine o'clock, the German batteries opened fire with a roar that was appalling.

The Third Army Corps, after a brief artillery duel, advanced on Soissons to cover the work of the engineers who were building a pontoon bridge for the French troops. The German fire was

deadly, yet though more than half their men fell, the engineers put the pontoon bridge across. German howitzer fire, from behind the ridge, however, soon destroyed the bridge. The Turcos crossed the river in rowboats and had a fierce but indecisive struggle in the streets of the medieval city. Meanwhile, with the failure of the pontoon bridge at Soissons, General Pulteney struck to the northeast along the road to Venizel. The bridge at that point had been blown up, but the British sappers repaired it sufficiently to set the Eleventh Brigade across, and even, despite the lurid hail of shot and shell, four regiments gathered at Bucy-de-Long by one o'clock on that Sunday, September 13, 1914. Over the heads of these courageous regiments towered the great hill of Vregny, a veritable Gibraltar of heavy guns with numerous machine guns along the wooded edge. There was no protection, and no shelter against the terrible German Maxim fire, so that the moment came when to attempt further advance meant instant annihilation. Still, under cover of the success of the Eleventh Brigade the engineers built a pontoon bridge at Venizel and the Twelfth Brigade crossed to Bucy-de-Long, with a number of the lighter artillery. As there was absolutely no shelter, to storm the height at that point was impossible, and to remain where they were was merely to court sudden death, so the Twelfth Brigade worked over the slopes to the ravine at Chipres, where they intrenched.

The task in front of the Second Army Corps was no less difficult. The bridge at Condé was too strongly defended to be taken by assault, as Sir Horace Smith-Dorrien speedily found out, so he divided his forces into two parts, one of which was directed at the village of Missy, two and one half miles west of Condé, while the other concentrated its attack on a crossing at the town of Vailly, three miles east of Condé. Both detachments made good their crossing, but the regiments that found themselves near Missy also realized that hasty, very hasty intrenchment was imperative, lest every one of them should be blown into kingdom come before half an hour had passed by. During the night some troops were rafted over, three men at a time, and these encamped near Missy. It was a false move. For sixteen days thereafter the

British troops had to remain in their dugouts, a large part of the time without food or water. To show a head above the trench was sudden death.

The regiments that crossed the river at Vailly found themselves in even a worse plight. No sooner had they crossed than the bombardment began, and the Germans knew every range in the place accurately. More than that, the line of trenches was open to enfilade fire from a hidden battery, which did not unmask until the trench was filled with soldiers. This Eighth Brigade had to retire in disorder.

The Fifth Brigade, attached to the First Army Corps under Sir Douglas Haig, an Irish and Scotch group of regiments, were the most successful of all. The bridge at Pont Arcy had been destroyed, but still one of its girders spanned the stream. It would have been tricky walking, even under ordinary circumstances, but nerve racking to attempt, when from every hill and wood and point of land, Maxims, machine guns and a steady rifle fire are concentrated on the man crossing that one girder. By the afternoon, the engineers attached to the First Army Corps had also established a pontoon bridge, and the whole brigade crossed the river in the evening and dug itself in.

Late on Sunday afternoon, however, a weak spot showed itself in the German line and Sir John French threw the First Division of the First Army Corps across the river near Bourg. Some of the infantry crossed by a small pontoon bridge and a brigade of cavalry started to follow them. When they were in mid-stream, however, a terrific storm of fire smote them. The cavalry pushed on, but could not ride up the hill in the teeth of the bombardment. The infantry were eager to go, but nothing was to be gained by the move, so the cavalry returned over the pontoon, by a most extraordinary occurrence not having lost a single member in the three hours it had been scouting on the hostile side of the Aisne. The infantry intrenched themselves solidly to await the morning.

The main forces of the First Division were especially lucky. Using the canal aqueduct they made their way toward Bourg, and drove the Germans back toward the main ridge.

More than three-quarters of the summit of the ridge had been

won, the entire Second Infantry Brigade was across, the Twenty-fifth Artillery Brigade was across, ready to support, and General Bulfin, instead of tiring his men by making them intrench there, ordered them to rest, throwing their outposts in front of the hamlet of Moulins.

This ended the first day's fighting on the battle of the Aisne. Of the Third Army Corps, a small body of men had reached Chipres. There they had been joined by a small force from the Second Army Corps. In the First Army a strong detachment dug itself in not far from Pont d'Arcy. The incomparably superior position of the Germans, their huge numbers, their possession of innumerable guns, made even this shaky tenure dangerous, though all held on. Sir John French had tested and found out the German strength and the result was not encouraging.

Although this repulse of the British army at every point was a decided victory for the German gunners, Field Marshal von Heeringen had been impressed by two things: the courage of the British attacking army, and the destructiveness of the French artillery on the south bank of the river. The German commander withdrew all his men from the advanced trenches on between the ridge and the river, keeping, however, strongly intrenched detachments of riflemen at all commanding points with powerful artillery as their support.

Sunday night was a veritable pandemonium of destruction and tumult. All night long, without cessation, the batteries of both sides, knowing exactly their opponents' range, fired perpetually. All night long searchlight bombs were thrown. All night long, golden and red and yellow streams of flame or the sudden jagged flash of an explosion lit up the black smoke of burning buildings and fields in the valley, or showed the white puff-like low clouds of the bursting shrapnel. Not for an instant did the roar diminish, not for a second was the kindly veil of night left unrent by a fissure of vengeful flame. Yet, all night long, as ceaselessly as the great guns poured out their angry fury, so did men pour out their indomitable will, and in that hell light of battle flame engineers labored to construct bridges, small bodies of troops moved forward to join their comrades in the trenches who had been

able to make a footing the day before, and all night long, those ghastly yet merciful accompaniments of a battle field—the ambulance corps—carried on their work of relief. The searchlights swept up and down the valley, like great eyes that watched to give direction to the venom of war.

At three o'clock in the morning of Monday, September 14, 1914, two regiments were sent to capture a sugar factory strongly held by the enemy. That sugar factory became a maelstrom. Three more regiments had to be brought up and finally the guards, and even thus heavily overpowered, the Germans successfully defended it until noon. They sold their lives dearly—those defenders. That sugar factory stood on that Monday as did Hogoumont at Waterloo. It delayed the advance of the entire First Corps, but at four o'clock in the afternoon, Sir Douglas Haig ordered a general advance. The last afternoon and evening scored a distinct success for the English arms, and when at last it grew absolutely too dark to see, that corps held a position stretching from Troton to La Cour de Soupir. Its chief importance, however, was that it gave the Allies a strongly entrenched position on the plateau itself.

It was of this day's fighting that, almost a month later, Sir John French was able to say in his official dispatches:

"The action of the First Corps on this day under the direction and command of Sir Douglas Haig was of so skillful, bold, and decisive a character that he gained positions which alone have enabled me to maintain my position for more than three weeks of very severe fighting on the north bank of the river."

The offensive of this entire movement was intrusted to the First Corps. The artillery strength of the armies of General von Kluck and Von Bülow was such that it was almost impossible for the Second and Third British Army Corps to assail them by a charge up the bluff. But, meantime, the French had not been idle. On September 13, 1914, General d'Espérey's Fifth Army crossed the Aisne east of Bourg, and on the following day commenced the assault on the Craonne plateau.

The next day, Tuesday, September 15, 1914, was a day of several small victories for the Germans. General von Zwehl was a

hard hitter and a quick hitter. Having disposed of his artillery where he thought it could be of the most use, he aided Field Marshal von Heeringen with counsels of counterattack, counsels that the Field Marshal fully indorsed. The Sixth French Army under General Manoury, at the extreme west of the line was the chief point of attack. Though well placed on a strong position at Nampcel, the Germans drove the French before them like clouds before the wind, recaptured the spurs, forced the French backward through the Morsain ravine and back to their original crossing place of the Aisne between Viv and Fontenoy.

The Third Corps of the British suffered heavy loss of life without any opportunity to retaliate, for it was too thoroughly and completely dominated by the guns of Vregny.

The lull of Wednesday, September 16, 1914, was a foretaste of the deadlock which was gradually forming. The French Fifth Army had been compelled to abandon all idea of a direct attack upon the Craonne plateau, the natural position being far too strong. The Second and Third Corps of the British army could do nothing. Sir John French, though eager to push the advantage, secured by his position on the heights was well aware that such a move was not possible unless the entire French line was ready to cooperate with him, for, if he tried to drive down upon the ridge of the Aisne, or, for that matter, tried to flank it, the line of the Duke of Württemberg would bend back upon him and nip him in a way which would render escape difficult.

A sudden recrudescence of activity on the western front gave rise to the hope that the deadlock might yet be avoided, that the two great armies might come to handgrips again. Bolstered up by reenforcements, General Manoury checked the German attack and regained all the ground that had been lost. Concentrating on the need of driving the invaders out of the quarries of Autrechtes, the French succeeded. This eased the western end of the line, and the Second and Third British Army Corps were left in peace.

Friday, September 18, 1914, is again a date of moment, not because anything of importance was transacted, but because nothing was transacted. It was a day of realizations. It was a

day that convinced the Allies that the German positions could not be broken down by frontal attack, just as the battles of the Marne had convinced the Germans that the road to Paris was not yet open. The six days from September 12 and 18 had revealed beyond peradventure that the German line along the ridge of the Aisne was not merely a convenient halting place for a rear-guard action, but that it was a great open-air fortress, almost impregnable and absolutely beyond the hope of storming. The forces were too evenly balanced for any concerted action to produce a desired effect, the possession of air scouts eliminated any question of a surprise. In other words, the conclusion was borne in upon the Allies with full force that, much as the German plan had failed at Marne, so had the Allies plan failed at Aisne. The crossing of the Aisne, the winning of the heights by Sir Douglas Haig were victories, not only that, but they were full of that glory which goes with successful daring—yet they led nowhere. The plan of the Allies must be abandoned and a new one formed. This decision of a change of strategical plan, then, closed the Allies frontal attack upon the position of the Central Powers on the ridge of the Maise, and marks the end of the first phase of the battle of the Aisne.

CHAPTER XXII

BOMBARDMENT OF RHEIMS AND SOISSONS

TO be considered almost as a part of the advance upon the Aisne, were the bombardments of Soissons and of Rheims, the former being a part of the first phase of the Aisne battles, the second belonging to the second phase. Soissons, it will be remembered, lies at the western end of the high bluffs that form a bank to the River Aisne for over fifty miles. It is on the high road between Rheims and Compiègne, and on the south side of the Aisne, and consequently returned into French hands on September 13, 1914. No sooner did the French armies enter the little

town, however, than Soissons, dominated by the twin towers of its ancient cathedral, became a target for the concentrated fire of the Germans, whose artillery, it will be remembered, had been supplemented that morning by the huge guns brought on from Maubeuge by the magnificent forced marches of General von Zwehl. By noon, the lower half of that once lovely city was in flames. On every hand walls collapsed as though they had been made of pasteboard. Women and children were buried beneath the ruins or blown to pieces as they fled into the streets. One of the towers of the cathedral was damaged, and there was not a corner of the town that was safe from fire. The French batteries tried to cover the city and silence the batteries opposing them on the north front of the river, but the odds were too great.

All day long, and throughout the greater part of every night, for the first three days of the battle of the Aisne, September 13, 14, and 15, 1914, the bombardment of Soissons was continual, and, in addition to being a wreck, the town became a shambles.

Closely allied to the Soissons' bombardment, and occurring simultaneously with the battle of the Aisne, being indeed an advance guard from the right wing of that great Germany army encamped on the ridge of the Aisne, was the series of engagements occurring in the quarries around Autrechies and Coucy le Chat. These engagements developed the illuminating fact that during times of peace German capital had been invested in these quarries and that the foresight of the Germans had led them to fortify these quarries, so that they were veritable fortresses, and indeed, formed a continuation of that line of defense the crowning point of which was the Aisne cliff near the plateau of the Craonne. During the days when the British First Army Corps, under Sir Douglas Haig, was performing the astounding feat of crossing the Aisne and holding the land thus gained against a veritable tempest of counterattack, these stone quarries were taken and lost again, every few hours. The French infantry of General Manoury's army, far less exhausted than the harassed regiments of General von Kluck's forces, found little difficulty in forcing the Germans back from Autrechies, but, no sooner were they well established, than the roar of the combined guns of General von

Kluck and General von Zwehl would make the position untenable, and under cover of that appalling rain of death, the German infantry would creep back to reoccupy the positions from which they had been ousted by the bayonets only a few hours before. It was the German tactic of machine vs. men, a direful and cruel battle plan to the opposing forces.

Upon the day that the advance of the British definitely stopped, or, in other words, when General Joffre and Sir John French realized that further effort against the defenses of the Germans on the ridge beyond the Aisne would only mean loss of life to no gainful purpose, the bombardment of Rheims began. The old city had suffered severely during the German advance upon the Marne. Still, it had not been pillaged, and when the Germans retreated across the Aisne the old city held much of its glory unimpaired. Still the flawless beauty of Rheims Cathedral stood guard over the ancient city.

Then on September 18, 1914, the shelling of the city began and a bombardment of the most terrific character continued for ten days. Rheims Cathedral, which the French declared was outside the zone of direct fire and was used as a hospital with the Red Cross flag flying, and which the Germans asserted to have been used for a signal station and to have been surrounded by gun stations, was demolished by the fire of the German siege guns. This act created a sensation throughout the world, for Rheims Cathedral was like a gem from Paradise, regarded by most art lovers as one of the most beautiful buildings in the world. Every civilized country was shaken with grief when the news of the disaster to Rheims Cathedral was published.

It must be admitted that military necessity knows no law, and it must also be admitted that human life has a valuation to be expressed in terms far higher than any building however beautiful. In an inspired article written by Major General von Dittfurth, in the "Hamburger Nachrichten," this latter point is clearly brought out. He wrote:

"It is of no consequence if all the monuments ever created, all the pictures ever painted, and all the buildings ever erected by the great architects of the world were destroyed, if by their de-

struction we promote Germany's victory over her enemies. . . . The commonest, ugliest stone placed to mark the burial place of a German grenadier is a more glorious and perfect monument than all the cathedrals in Europe put together.

"Let neutral peoples and our enemies cease their empty chatter, which is no better than the twittering of birds. Let them cease their talk about the cathedral at Rheims and about all the churches and castles of France which have shared its fate. These things do not interest us."

Opinions will differ concerning General von Dittfurth's appraisal of the comparative values of Rheims Cathedral and the tombstone of a German grenadier, but, after all, sentiment and estheticism cannot be allowed to interfere with military necessity, nor even to menace military caution. If Rheims were far away from the line of march, and if the Germans had deliberately gone thither for the purpose of destroying it—as some prejudiced accounts seem to state—then there would not be room for two opinions. Wanton vandalism is vandalism largely in the ratio that it is wanton. But, to be perfectly impartial, it must be admitted that the second phase of the battle of the Aisne made the bombardment of Rheims a military necessity. To make this clear requires a setting forth of the new strategical plan developed by Field Marshal von Heeringen, upon the collapse of the plan for the drive on Paris, which was foiled by the battles of the Marne.

CHAPTER XXIII

SECOND PHASE OF BATTLE OF THE AISNE

THE second phase of the battle of the Aisne contained two factors. One, the simplest, was the maintenance of that line of defense against any odds that could be brought up against it by the Allies. It meant the formation and the defense of an open-air fortress that might even defy Fate. The history of the

trenches that winter, of which more will be said later, reveals the extent to which the Germans succeeded, aided by the iron craft of the old Prussian fighter General von Zwehl.

The other factor depended on the vexed question of means of communication. There was no cross-country railway linking the eastern German wing to the western German wing. As has been previously remarked, all supplies and munitions had to come in a roundabout way. Verdun was a desired goal, but Field Marshal von Heeringen was wise enough to know that if the crown prince's effort against General Sarrail had failed, if the Third French Army had secured heavy reenforcement, and if it had been left unmolested for a week, the outer ring of defenses around Verdun would, by that time, have become so amazingly strengthened that direct or frontal attack would be impossible, while the flanking attack had failed. It was vain, therefore, at the present time, to hope that the establishment of the direct communication between Metz and Verdun might pass into the hands of the invaders.

On the other hand, there was a direct line of railway running through Rheims, Rethel, Mezières to the great war depot, Coblenz on the Rhine. A branch line from Metz, through Luxemburg, thus gave communication to the eastern wing. All the links of this were in German hands, except Rheims, and if that railroad center could be secured, the importance to the German advance would be enormous. Under such circumstances, it can scarcely be held that Rheims was not necessarily a point, the attack of which was due to military necessity.

The formation for this began on September 17, 1914. Crossing the Aisne by the old ford of Berry-au-Bac, a powerful army under the direct leadership of Field Marshal von Heeringen debouched upon the open country between Berry-au-Bac and Suippes, east of Rheims. It was at this point that the German commander in chief of this section of the battle line intended to deliver a crushing blow by which might be regained the prestige secured at Charleroi and lost again at the Marne.

Surprise may be felt that so important a railway center as Rheims should not have been a strongly fortified place. It had

been so, once, though the fortifications were old-fashioned. But, instead of bringing these points of natural defense up to the highest degree of modern efficiency, the French had dismantled them entirely, so as to make Rheims, with its glorious cathedral an open town, safe from bombardment. It was, according to the rules of war, safe from bombardment, but only in the event of its not being defended. General Foch did not dare to take this stand. He knew, as well as did General von Heeringen, the strategic value of Rheims as railroad center, and accepted the issue of battle.

In the falling back of the several German armies from the Marne to the Aisne, the Germans had kept possession of the chief forts of the district around Rheims. No strong effort had been made to dislodge them, for the forward movement of the Allies had been directed against the fortified heights of the Aisne, facing the Soissons-Craonne defense. It will be remembered that the armies of General Foch and Langle, especially the latter, had taken no part in the First Phase of the Battle of the Aisne, but had stubbornly thrown back the armies of the Duke of Württemberg, which had combined with those of the crown prince. The right wing of this large conjoined army had held the fort sites around Rheims and especially they had made full use of the chief fort on the wooded heights of Nogent l'Abbesse, a trifle less than half a mile from the cathedral city and therefore within easy destructive shelling range. The heavy artillery was planted here, the infantry intrenched around it, and strong defense trenches were established along the River Suippe, that runs into the Aisne near Berry-au-Bac.

On Friday, September 18, 1914, the first movement of this Second Phase was begun, when the Germans launched a sharp counterattack on the French center. This was the first German offensive movement since their retreat from the Marne, and it was powerful and well handled. General Foch fell back into defensive positions, but had much ado to hold his own. He evaded giving battle around Rheims and took up a position at Souain, which he held with the jaunty obstinacy he had displayed so often in the retreat through northern France. It was

obvious that he could not hold out long, but by clever generalship, and especially by an extraordinarily brilliant use of the cavalry arm, he held off the army for that day. That night, strong reinforcements came to his aid, and on September 19, 1914, the balance of the forces was more nearly equal.

On September 19, 1914, therefore, the situation of the armies was much as follows: The Germans, acting under the general command of Field Marshall von Heeringen, controlled Rheims under the gunfire of their heavy artillery from two points, the heights of Nogent l'Abbesse to the southeast of Rheims, and the hill of Brimont a little over half a mile to the northeast. Their right flank was covered by the powerful defenses of the Aisne and the guns of the Craonne plateau, their left flank was a series of intrenchments along the river Suippe, which merged into the second line of defense of the main army under the Duke of Württemberg.

On the other side of Rheims, or to the west of the cathedral city, the Allies also held two heights, one at Pouillon, between the Aisle and the Vesle, and therefore to the northwest of the city, and the other on a sharp steep, known as the Mountain of Rheims, near Verzenay, on the south side of the river. This was therefore west and a little south of Rheims. But, and herein lies the question that has so often arisen in the discussion of the comparative strength of the two armies—especially without the British batteries—the French lacked heavy long range artillery. They had no such howitzers as those of the German forces. Thus the Germans could shell Rheims to their hearts' content, and the Allies could not silence that gunfire from their own fortified positions. Once more, then, it became a battle between infantry and artillery, between men and machines.

This time, however, the advance was not favorable to the Germans. Their heavy artillery commanded Rheims, but it did not command the French line to the west of Rheims. The invaders performed prodigies of valor. Again and again they hurled themselves against the French line. But General Foch's troops were well supplied with that terrible engine of destruction—the semiautomatic gun, equipped (as in the French pat-

tern and not the German) with an automatically correct time setter for shrapnel and melinite shells.

In four successive night attacks on September 19-20, 1914, the heaviest onset was made. Supported by a terrific gunfire, directed with the long pointing fingers of searchlights, the German infantry, invigorated by a week's rest, rolled up in gray-clad tidal waves against the French line. General Foch had known how to post his defense, and within twenty-four hours he had made the line between Pouillon and the Mountain of Rheims almost as strong as the German line between Brimont and Nogent l'Abbesse. Poor Rheims lay between, wide open to the eruption of destruction that belched from the throats of the German howitzers.

CHAPTER XXIV

RHEIMS AGAIN BOMBARDED

ON September 20, 1914, the direct bombardment of Rheims began. The main advance of the Germans had again failed, and again it had been the strategy and military leadership of General Foch that had won the day. The bombardment of Rheims began, and with it, the bombardment of the cathedral. Enough has been said to show that the bombardment of Rheims can readily be explained as a part of the general movement of the second phase of the battle of the Aisne, but it is only fair to quote the statements made by the Allies with regard to the pointedness and deliberation of the German gunfire upon the cathedral.

"The German military authorities," wrote H. W. Wilson, one of the British military experts, "alleged that there was a French battery near the cathedral and that it was so placed as to bring the sacred building in the line of fire from the opposing German battery. As a matter of fact, there were some French guns a mile to the north of the cathedral and some other French guns two miles to the south of it. It was the latter battery which

the Germans said they were aiming at when they smote the cathedral. As was said by the American author, Mr. Richard Harding Davis, who was in Rheims when the bombardment began, 'to accept the German claim we must believe that continuously for four days they aimed at a battery, and, two miles from it, continuously hit the cathedral of Rheims.'

"Even in the hour of their defeat (it has been mentioned that this is a British source) the Prussians were not so blind with rage as that. They were firing 6-inch shells at a distance of some 7,000 yards from Nogent l'Abbesse hill. Adjoining the cathedral is a well-known hotel with a German proprietor. The gunners—whose marksmanship was, indeed, exceedingly good—pitched their shell so exactly that for four days—from Saturday September 19, 1914 to Tuesday, September 22, 1914—each shell fell on the cathedral and the archbishop's palace and robing room of the Kings of France, without a splinter injuring the German hotel hard by." This is probably an overstatement, but presents the opinion generally expressed by the Allies at the time.

It was on Sunday morning, at the time usually held consecrate to religious services, that one of the German shells struck the scaffolding erected round the left tower for restoration work. The fact that the great cathedral was now being used as a hospital for the German wounded soldiers and was flying two Red Cross flags did not save it. The scaffolding flamed and the fire spread to the old arched roof of oak above the lower roof of stone. The molten lead from the gutters dropped upon the straw in the nave on which the wounded Germans were lying, and the interior also became a mass of flames threatening to burn the wounded men alive.

Swift to the rescue sprang the gray-haired Archbishop Landreux, who, at the time, was reciting his Holy Office. Remembering who it was that had said "Greater love hath no man than this—that he lay down life for his friend," the aged prelate, with a young athletic, manly priest, Abbé Chinot, who was in charge of the cathedral, rushed into the flaming fane. Within the straw was ablaze, overhead the timbers were crackling, little

glistening drops of molten metal menaced them every few yards and shells were dropping steadily, but the two clerics began the work of rescue, the archbishop, whose strength was not great, helping those that were able to stagger a little, while Abbé Chinot bodily picked up the wounded men and dashed with them to the North Portal, out of shell fire. Doctors and nurses rushed to aid.

Then one of the strange fits of mob fury, which spring up no one knows whither, seized some of the people of Rheims. Made frantic by their losses, for hundreds of peaceful inoffensive citizens had been killed in the streets by the gunfire of the day before, filled with vengeful hate at the sight of their beloved cathedral in flames, a sudden crowd appeared at the great door of the cathedral and clamored that the wounded men would be allowed to die in the hell of their comrades' making. More than one rifle was raised and pointed at the wounded men who had already been carried out.

The gray-haired archbishop, a Prince of Men as well as a Prince of the Church, stepped quietly forward.

"Very well, my children," he said as he placed himself between the mob and its intended victims, "but you will fire upon me first."

The hoarse shriek of the shells continued, the drumming of the gunfire throbbed in the air, but in the crowd there was silence. Then, with a perception of greatness that is common to the hearts of all men, no matter on what side of any cause they may be fighting, the foremost ranks of the crowd leaped forward as one man, vying with each other to be the first to volunteer in the rescue of their enemies.

And, through the whole scene, the statue of Joan of Arc looked on at the brave act of a prelate she would have delighted to honor, and at the recognition of that courage by the people she herself gave her life to save.

CHAPTER XXV

END OF THE BATTLE

AFTER September 22, 1914, there was a lull in the fighting at Rheims, and as afterwards appeared, this was due mainly to another change of plan on the part of the German Staff. But it was no part of General Foch's intentions to leave the bombardment of the cathedral unrevenge. He had, indeed, caused an unparalleled slaughter on the night of September 19, as has been stated, but his troops were avid for reprisal and the French strategist knew well how dangerous it is to allow an army, eager for action and revenge, to eat its heart out vainly. He was too wise to run the risk of a countercharge, but four days later, his opportunity came, and he took advantage of it to the full.

At dawn on September 26, 1914, a detachment of 15,000 Germans, including all that remained of the famous Prussian Guards Corps, that same body that had fought so marvelously on many occasions, and which had suffered the most cruelly in the affair of the marshes of St. Gond, made a sortie from the base line at Nogent l'Abbesse to destroy the railway line between Rheims and Verdun, this line was, indeed, the principal link of communication to that all important fortress that protruded its bristling salient into the heart of the German position. A French aviator, who had climbed into his machine when it was yet dark, in order to do a little daybreak scouting before the light should be sufficiently bright to make him an easy target, saw this movement and reported it immediately to General Foch. That commander, who knew how to use cavalry, ordered a regiment at the gallop to occupy the village of Auberive, on the Suippe, and there harry the advancing column sufficiently to give him time to bring up the light artillery and to bring into action a large body of infantry encamped at Jouchery, five miles away.

Before six o'clock, the cavalry were in Auberive. The men worked like fiends. The streets were rapidly barricaded, ma-

chine guns hoisted to roofs and other points where they might command a wide sweep of fire. Then the cavalry rode forward to meet the advancing column. Not knowing what might be in front of him, the German commander halted, awaiting reports from his air scouts. The halt was but three-quarters of an hour, but that was of vast importance. The scouts reported only a regiment of cavalry ahead, but a powerful detachment of French artillery on the road from Jouchery. The German leader detached 2,000 of the Death's Head Hussars, his crack cavalry, to cut off, or at all events to delay, the French guns. He was aware that the artillery would have no anticipation of this and, in the surprise, the guns might be captured. Meantime, he hurried his advance to Auberive, captured the village, though after another hour's delay, caused by the resistance of the cavalry, who retreated to St. Hilaire.

Meantime, at St. Hilaire, the surprise charge of the Death's Head Hussars was launched. It was scarcely a question of minutes, it was rather a matter of seconds. But the French artillery knew their light field pieces as thoroughly as the Germans were masters of the heavy guns. In less than two minutes the artillery teams were unharnessed, the guns were in position and the gunners took their places when the Hussars were so near, the voices of their leaders could be heard. Thirty seconds earlier, and the Hussars would have been in among the guns and made a notable capture. There was just time enough for a man to breathe twice, when the order came to fire. The Hussars were at less than a hundred yards range. As the shrapnel burst, the front squadrons seemed to stumble and fall. The ranks were so near that the change from living human beings into mangled pieces of flesh and rags could clearly be seen. More than one veteran gunner felt squeamish at the sight. But the rear squadrons, though their horses' hoofs were squeaking in the blood of their comrades of a moment before, never blenched or faltered but swept on at a thundering gallop. Again the guns spoke, and again. That was all. Amid the vines, here and there a writhing figure could be seen, or a wounded horse endeavoring to rise, and here and there a straggler striving to escape. It

was level open country, twice again the guns roared, five rounds in all, and all movement ceased. The engagement had lasted less than five minutes and of those two thousand splendid horsemen not one escaped. The French artillerists picked up the wounded and sent them back to Rheims to receive nursing and care, and then hurried on to the action whither they were bound when surprised by the Hussars.

The infantry of the Germans and of the French were now coming to hand grips. A battalion of Zouaves was creeping round to attack the advancing column in the rear. The German commander at Nogent l'Abbesse learned from his air scouts what was happening. He saw the peril of the advancing column, that it was almost surrounded and he threw further columns into the fray, to cover the retreat. The sortie on the railway had now become impossible. General Foch had moved too quickly. But, even so, the peril was great, for the German army was almost cut off. It meant the loss of 15,000 men and artillery, or it meant the sacrifice of some one corps to cover the retreat. The latter course was chosen.

Three thousand of the Guards Corps, the flower of the Prussian Army, were sent like a catapult at the gap in the French line, immediately in front of Rheims. Five times they charged, and that with such heroic daring and such penetrative energy that General Foch did not dare break from his position. As they came up for the fifth assault, a wild cheer of admiration broke out along the French line. But the rifles spoke steadily, none the less for that. After the fifth assault, barely a hundred men were left, nearly all wounded. They reversed rifles, a sign of surrender, and in all honor they were received by General Foch, who conducted them to the hospital in his rear. They lived up to the full the most heroic traditions of the old Prussian corps and they saved that whole German force from destruction. Still, with the annihilation of the Death's Head Hussars and the remainder of the Prussian Guards Corps on the same day, the forces under General Foch felt that in part Rheims had been avenged.

The other section of this second phase of the Aisne consisted

of the trench warfare, which solidified from September 19 to October 6 under conditions of extreme difficulty and more than extreme discomfort. It was practically the establishment of a trench campaign that lasted all winter, and it taught the Allies much of that molelike strategy in which the Germans were so wonderfully proficient. The French during that winter on the Aisne never quite succeeded in rivalling the mechanical precision of the German movements; the Germans, on the other hand, never showed themselves to possess the emotional fervor of the French with the bayonet.

In many places German and Allies' trenches almost touched each other. The first two weeks at the Aisne were one continual downpour, and the foundation of that ground is chalk. On the sides of the plateau of Craonne, after two weeks rain, the chalky mud seemed bottomless. "It filled the ears and eyes and throats of our men," wrote John Buchan, "it plastered their clothing and mingled generously with their diet. Their grandfathers, who had been at Sebastopol, could have told them something about mud; but even after India and South Africa, the mire of the Aisne seemed a grievous affliction." The fighting was constant, the nervous strain exhausting and the cold and wet were even harder to bear. There had as yet been no time to build trenches with all conveniences, such as the Germans possessed on the crest of the ridge, and the trenches of the Allies were a chilled inferno of woe.

A stretch of waste ground lay between the trenches, and often for days at a time, the fire was too heavy to rescue the wounded or bring in the dead. The men in the trenches, on either side, were compelled to hear the groans of the wounded, lying in the open day after day, until, exhaustion, cold and pain brought them a merciful release. In letters, more than one soldier declared that the hardest thing to bear was to hear a fellow comrade shrieking or groaning in agony a few steps away, for hours—even days at a time—and to be able to do nothing to help. The stench from the unburied bodies was so great, that officially all the tobacco for the whole battle front was commandeered and sent to the trenches under the plateau of Craonne and on the

hill to the westward, where the British First Army Corps was placed. Such, for the two weeks between September 22, 1914, and October 6, 1914, was the trench warfare during the second phase of the battle of the Aisne, a condition never after repeated in the war, for such a feat as the crossing of the Aisne could scarcely be duplicated. It was gallant, it was magnificent and it was costly—the British casualty list for September 12, October 6 being, killed, wounded and missing, 561 officers and 12,980 men, but it was useless, and only served to give the Allies a temporary base whereby General Foch was successful in checking the German attempt to capture the Rheims-Verdun railway. It was a victory of bravery, but not a victory of result.

During all these operations the Belgian army, now at Antwerp, had harassed the German troops by frequent sorties. The capture of the city was at once undertaken by the German Staff, following the stalemate created by the operations at the Aisne.

CHAPTER XXVI

SIEGE AND FALL OF ANTWERP

THE siege of Antwerp began on September 29, 1914, and in less than two weeks, October 10, 1914, this historic city, one of the most important trade centers of the world and one of the strongest fortresses in Europe, was forced to capitulate, though it had always been believed to be impregnable.

During the latter part of September, 1914, the forces of the belligerents were driving northward in that memorable race for the Channel in which both sides had the same object: each was trying to be the first to turn the other's front and crumble his line. At the same time the German forces, then in the vicinity of Brussels, under the command of General von Beseler, pushed toward Antwerp, on which the Belgian army had fallen back to make its last stand. This move was necessary in order to cut off all danger of rear attacks which would menace General

von Kluck's drive to the coast, a movement which had reached Douai on October 1, 1914.

The German General Staff had decided to take Antwerp at all cost. General von Beseler on the last day of September, 1914, reached a point within range of Antwerp's farthest outer forts.

In order to understand the record of the following successive steps in the siege of Antwerp, a description of this city's position and the location of its double circle of forts is necessary. Antwerp was considered one of the most formidable strongholds in the world. The elaborate defenses of Antwerp evolved from the original fortifications of thirty years ago through continual additions. The location of the city offers very many natural advantages for its defense, and the engineering genius controlling the work made full use of these opportunities. From the north Antwerp has access to the sea by the river Scheldt, of which the arm nearest to the city is narrow, with six strong forts on each bank, including the citadel.

Any armies approaching from the south must cross the rivers Rupel and Nethe, which practically, in the shape of a semicircle, swing around the city to the south at a distance varying from about six to twelve miles. Within this circle of flowing water, and about two miles from the city, is another circle, formed by twelve powerful forts. At a point almost due east from the center of the city and commanding the railroad to Holland, by way of Turnhout, is located the first of eight forts, designated by numbers. From there they swing to the south and west, with fort eight very close to the Scheldt and directly south to the village of Hoboken. On the other side of the river are Forts de Cruibeke and Zwyndrecht, the latter commanding the railroad to Ghent. Further north and right on the banks of the Scheldt are Forts St. Marie, la Perle, and St. Philip, the first two on the left bank and the last on the right, all three opposite the new harbor and docks. In the northeast Fort de Merkem guards the railroad to Rotterdam. Outside of this circle and in the south, outside of the Nethe-Rupel line, there is another complete circle of nineteen even stronger forts, at a distance from

LIEGE FORTS, SHOWING GERMAN ATTACK

SIEGE AND FALL OF ANTWERP

the city varying between five and ten miles. Starting again in the east—due east from fort one—and swinging south, these forts are named: Oeleghem, Broeckem, Kessel, Lierre, Koningshoeyck, Wavre St. Catherine, Waelhem—the last two only a few miles north of Malines—Breendonck, Liezel, Bornem, Rupelmonde, Haesdonck, Doel, Blauwgaren—the last two guarding the Scheldt at the point of its entrance into Holland, one on each bank—Stabroek, Ertbrand, Brasschaet, Schooten, and Gravenwezel. Between these outer forts there were redoubts of considerable strength, which were armed with 4-inch guns. The forts of the inner ring are placed at regular intervals of 2,200 yards and at a distance of about 3,500 yards from the enceinte of the city, which itself had powerful defenses as well.

Add to these defenses the important fact that the entire district surrounding Antwerp was subject to inundation to such a depth that all approach to the city could be made impracticable to an enemy force with heavy cannon and ammunition. Military authorities held Antwerp to be of incomparable strength and as nearly impregnable as engineering genius could make it.

During the latter part of September, 1914, several of the outer forts were subjected to bombardment, and many of these had become useless as defenses.

General von Beseler's advance was still barred by the river Nethe, upon the opposite bank of which the defense was concentrated. During the engagements which now ensued the German aircraft kept the commanders advised as to conditions behind the enemy's lines, now and then dropping bombs apparently doing considerable damage.

On October 2, 1914, General von Beseler scattered from "Taube" aeroplanes a number of printed papers over the entire district. These circulars contained a proclamation to the Belgian soldiers, advising them to stop fighting for England and Russia and to return home to their wives and children, as Germany was ready to help and befriend them.

The Belgian Government, which had established itself in Antwerp after the occupation of Brussels, decided to leave the city as soon as possible. Two small steamers were ordered to be

held in readiness. The foreign legations also decided to go with the Government.

Throughout this day a steady fire was kept up on the nearest outer forts, but the Belgian soldiers contested every inch of ground against the German advance. This fighting continued throughout the entire day following, during which two of the minor outer forts were silenced.

Rapid progress by the Germans was very difficult owing to the peculiar conformation of the course of the river Scheldt at the point of attack. This made especially difficult the laying of concrete foundations for the heavy guns.

The first detachment of British troops, numbering about 8,000 marines, reached Antwerp on October 3, 1914. This buoyed up the spirits of the Belgian soldiers and redoubled their efforts. Under cover of the continuous fire of their guns, the Germans made determined efforts to cross the river Nethe at Waelhem. Desperate fighting, which lasted all night and until early in the morning of October 4, took place. This attempt, however failed. Later in the day the Germans succeeded in putting a pontoon bridge in place. Troops in solid masses hurried across; but as they reached the other side some well-directed shots from the Belgian guns blew the pontoon bridge to pieces, killing many.

Throughout the night of October 4, 1914, and the day and night of October 5, the battle raged about Lierre with savage ferocity. The British marines had by this time relieved the Belgians. The German fire, however, compelled the defenders to draw back a considerable distance.

At four o'clock in the morning of October 6, 1914, the Germans succeeded in crossing the river in force, and now the defenders were obliged to give way, as the outer forts had ceased to afford them any protection. Late in the afternoon the members of the Belgian Cabinet and their official families went aboard one steamer, while the French and British Legations boarded another, both sailing early on October 7.

The Belgian troops had begun to withdraw the evening before. All the defending forces now hastened their retreat. The actual evacuation had indeed begun. Time was taken, however, to

put out of commission some thirty steamships lying at their docks and to set afire all the large oil tanks on the west side of the river Scheldt. The streets in Antwerp presented scenes of almost indescribable confusion. Even before the bombardment had been long in operation almost the entire civil population became panic-stricken. Hither and thither, wherever the crowd drifted, explosions obstructed their paths; fronts of buildings bent over and fell into the streets, in many cases crushing their occupants. Although the burgomaster had issued a proclamation advising the people to remain calm—indoors, if possible—nothing could stop the stampede.

The defending troops withdrawing through the city from the firing line destroyed everything that might possibly be of use to the enemy. The suburbs of Antwerp seemed to be ablaze in every direction; the village of Waerloos had been burning for some days; Contich, Duffel, and Lierre also, and Have, Linth, and Vieux Dieu had been destroyed by shell fire. Mortsel was practically obliterated by the Belgians clearing the range for the guns of the inner forts. In the preparation for defense the Belgians destroyed upward of ten thousand buildings within a radius of twenty miles.

The exodus of the civil population began in earnest on October 8, 1914. Some of the streets in the heart of the city were choked with people, while other streets in the same vicinity were dead and deserted. The withdrawal of the troops was well screened from the German guns, but their retreat to the west had been cut off to a great extent, and Holland was now the only refuge for many. The Germans did not use their heaviest guns and high-explosive shells in bombarding the city.

During this terrible time, in utter darkness and confusion, crowds amounting to many thousands—men, and women with babies, and children of all ages—streamed through the streets that led to the quays or to the turnpike to Holland. All sorts of vehicles, from dogcarts to motor trucks, the former drawn by dogs, men, and horses, carried the belongings of the fugitives that could not be carried away in person.

The bombardment continued with varying severity through-

out October 8, 1914. As the Germans drew nearer to the city all the inner forts on the south and east sides of the circle took part in replying to the cannonade. Some of these forts—notably two, three, four, and five—were badly battered. By afternoon the city seemed deserted—nothing but *débris* of fallen buildings and wreckage met the eyes, and a small remnant of the population was still struggling for escape.

Along all the wayside immense crowds of men, women, and children gathered. The railway stations were choked with struggling humanity. Their condition was pitiable. These scenes continued all day and throughout the entire night.

On the morning of October 9, 1914, the struggle to get away continued. Long lines formed on the quay where it had been reported that two boats would leave for Ostend by eleven o'clock, and all those that could pay struggled to get their passage booked. There were between 35,000 and 40,000 people on the quays, every one buoyed up by the hope that safety was in sight at last. But the boats failed to sail and a murmur of disappointment rose from this vast multitude of unfortunates.

However, there were other means of escape available, such as tugboats, plying between Flushing, Rotterdam, and other adjacent points in Holland. These tugs had no great accommodations for passengers and comparatively few people escaped by this means. No trains were scheduled to run and in despair the crowds started to cross the bridge and make for the road to the Dutch frontier. Altogether from 150,000 to 200,000 of the population of the city escaped by one means or another.

During a continuous bombardment of twelve hours the cathedral stood unharmed. The southern part of Antwerp was a desolate waste of ruins. In some streets all the homes were ablaze, the flames leaping hither and thither with the wind. The great oil tanks burning fiercely on the opposite bank of the River Scheldt were fired upon by some well-directed shots to check the blaze, a huge black volume of thick smoke now rising from the flames. To add to the difficulties and confusion the water supply had been cut off during the early stages of the bombardment through the destruction of the city's waterworks which were lo-

cated in one of the suburbs to the south, and the consequences threatened to become alarming. Everywhere fires were burning.

This was the tragic scene when the German army entered the conquered city of Antwerp on October 10, 1914. It is probable that a large part of the city would have been burned, if the Germans had not entered in time to check the conflagration. Without loss of time, forces were put to work fighting the fires and clearing the streets, propping up unsafe buildings and making order out of chaos, with the usual Teuton efficiency. As soon as the bombardment had ceased proclamations were pasted on walls and houses throughout the city urging everyone to surrender any arms in their possession and begging for a calm demeanor when the German troops pass through the streets.

About noon on October 10, 1914, a patrol of cyclist-mounted police escorted the Burgomaster to the gate of the city to receive the German forces. When they entered order was restored without delay. Soldiers were immediately detached from their special command and formed into gangs under competent foremen and all put to work at once each according to his trade, fitness or adaptability. The forts that had been dismantled were hastily patched up and new guns mounted for emergency use.

On October 11, 1914, Field Marshal von der Goltz, the Governor General of Belgium, came from Brussels and made a tour of inspection of the double girdle of forts. Upon examination it was found that the actual damage done to the city by the bombardment was comparatively slight.

During the last days of Antwerp's reign of terror fully 300,000 fugitives sought shelter in Bergan-op-Zoom about twenty-five miles northward across the Dutch frontier. Most of these were in a condition almost indescribable, ragged, travel worn, shoeless, and bespattered and hungry. Few had money; valuables or other resources. All they owned they carried on their backs or in bundles. The little Dutch town of Bergen-op-Zoom with but 15,000 inhabitants was swamped; but the Hollanders did their best to meet this terrible pressure and its citizens went without bread themselves to feed the refugees. Slowly some sort of order was organized out of the chaos and when the Dutch

Government was able to establish refugee camps under military supervision the worst was over. A majority of this vast army was by degrees distributed in the surrounding territory where tent accommodations had been completed. The good Hollanders provided for the children with especial care and sympathy. They supplied milk for the babies and children generally. Devoted priests comforted many; but military organization prevailed over all. Among the thousands of these poor refugees that crossed the frontier at Maastricht and besieged the doors of the Belgian consul there was no railing or declaiming against the horror of their situation. The pathos of lonely, staring apathetic endurance was tragic beyond expression.

CHAPTER XXVII

YSER BATTLES—ATTACK ON YPRES

A LARGE part of the Belgian forces with some of the English marines were forced across the Dutch border, where they were promptly disarmed and interned, while the remnants of these forces fled toward the west by way of St. Nicolas and reached Ostend on October 11 and 12, 1914, with greatly reduced numbers. Many were cut off and captured by the German forces, which entered Ghent on October 12, and pressed on to Ypres in one direction and to Lille in another. Next day, the thirteenth, they approached Ostend, forcing these Belgians who had managed to get through, to evacuate.

Bruges was occupied by the German forces on October 14, 1914, and other detachments appeared in Thielt, Daume, and Esschen on the same day, thus getting under their control the entire Kingdom of Belgium, with the exception of the northwestern corner, north of Ypres, to the coast of the channel. For Ostend, too, had fallen into their hands by October 15, after the English and Belgian troops had been taken away by an English fleet; the Belgian's were transported to France where they were

re-formed while the English marines were sent back to England.

In the meantime the Germans were drawing on reinforcements from the Voorges and the Champagne districts and every day their numbers increased. West Flanders was swarming with German cavalry, and about this time they were as far west as Hazebrouck and Cassel, and only twenty-five miles distant from Dunkirk.

By October 20, 1914, the allied line was in position from Albert to the sea, a little short of 100 miles, eighty as the crow flies. From south to north the allied front was commanded by General Maud'huy from Albert to Vermelles; General Smith-Dorrien from Vermelles to Laventie, opposite Lille; General Poultney, from Laventie to Messines; General Haig from Messines to Bixschoote; General de Mitry had French and Belgian mixed troops defending the line from Bixschoote to Nieuport and the sea, supported by an English and French fleet.

For days this fleet under the British Admiral Hood had shelled the coast defenses under General von Beseler's command. As the naval guns had a far better range than General von Beseler's artillery, it was an easy matter to hold the coast at Nieuport Bains, and even six miles inland without subjecting any of the ships to the fire of the German guns.

On the German side General von Bülow held the front against General Maud'huy, the Bavarian Crown Prince against General Smith-Dorrien, while the Duke of Württemberg commanded the forces on the balance of the line to the sea. It is estimated that upward of thirty army corps covered the German front.

Throughout the balance of October, 1914, and well into November, 1914, a great many different actions and some of the heaviest fighting of this period took place all along this line. On the 21st the new German formations pressed forward in great force all along the line. On the south of the Lys the Germans assaulted Violaines. On the north of the Lys in the English center a fiercely contested action took place near La Gheir, which village the Germans captured in the morning. The German Twenty-sixth Reserve Corps pressed on to Passchendale, where they met with stout resistance from the English-Belgian forces.

On October 22, the Germans attacked from the La Bassée region and gained several small villages. Both Allies and Germans suffered immense losses. Much of the slaughter was due to the point-blank magazine fire and the intermittent shrapnel explosions from both sides.

The most savage fighting was kept up all along the line, but no advantage accrued to either side until Friday, October 23, 1914, when the Germans succeeded in crossing the Yser at St. George and forcing their way to Ramscapelle, a distance of about two miles. This was accomplished by General von Beseler's troops, opposing the mixed troops of the Belgian and French. On that night fourteen separate attacks were made by the Germans on Dixmude and they were repulsed each time.

On October 24, 1914, about 5,000 German troops crossed the canal at Schoorbakke and next day there were more to come, so for the moment it looked as though the allied line on the Yser had been broken. The struggle at this point continued until October 28, during which time the Allies contested every inch of ground. The Kaiser was with the Duke of Württemberg on this day, expecting every moment that his great design to break through the lines and drive his forces to Dunkirk and Calais would be accomplished.

At the crisis the Belgians broke down the dykes, and flooded the country for miles around. Heavy rains during the last weeks had swelled the Yser. The Belgians had dammed the lower reaches of the canal; the Yser lipped over its brim and spread lagoons over the flat meadows. Soon the German forces on the west bank were floundering in a foot of water, while their guns were waterlogged and deep in mud. The Germans did not abandon their efforts. The Kaiser called for volunteers to carry Ramscapelle—two Württemberg brigades responded—and gained the place, but at terrible loss.

On the 30th of October, 1914, again the Württembergers advanced to the attack. They waded through sloppy fields from the Bridge heads at St. George and Schoorbakke, and by means of table tops, boards, planks and other devices crossed the deeper dykes. So furious was the attack pressed home that they won

the railway line and held their ground. They were to do some severe fighting, however, for next day French-Belgian and African mixed troops fought fiercely to drive the Germans back but failed.

Seeing their success in partially flooding the battle field, the Belgians made more breaches in the dams, and, opening the sluices in the canal, threw a flood of water greater still over the area occupied by the Germans. In seething brown waves the water rose up to the high ground at the railway near Ramscapelle. The Germans were caught in this tide and scores of them were drowned. Many escaped, some struggled to land on the Allies front and were made prisoners.

Sir John French summarized part of the fighting in Flanders, after the capture of Antwerp, in the following official report: "The Second Corps under General Smith-Dorrien was opposed by overpowering forces of Germans, but nevertheless advanced until October 18, 1914, when the German opposition compelled a re-enforcement. Six days later the Lahore Division of the Indian Army was sent to support the Second Corps. On October 16, Sir Henry Rawlinson, who had covered the retreat of the Belgian army from Antwerp, with two divisions of English cavalry and two divisions of French infantry, was stationed on the line east of Ypres under orders to operate over a wide front and to keep possession of all the ground held by the Allies until the First Army Corps could reach Ypres.

"General Rawlinson was opposed by superior forces and was unable to prevent the Germans from getting large reinforcements. With four army corps holding a much wider front than their size justified he faced a rather awkward situation, as the enemy was massed from the Lys.

"The shattered Belgian army and the weary French troops advanced to check the Germans—but in vain. Sir Douglas Haig with the First Army Corps was sent to recapture Bruges on October 19, 1914, while the Belgian army intrenched along the Yser Canal. General Haig failed—owing to bad roads. October 21, brought the most severe attack made on the First Corps at Ypres, in the checking of which the Worcestershire Regiment did

good work. This day marked the most critical period in the battle which resulted in the recapture of the village of Gheluvelt."

South of Dixmude is one of the most historic and quaintly attractive cities of Belgium, Ypres. It is situated on a tributary of the Yser called the Yperlee, and a railway runs through it from Roulers to the main Lille-St. Omer line at Hazebrouck and a very important canal runs from the Yser in the North to the Lys at Comines.

The allied lines were held by the British First and Third Corps and several cavalry divisions, at this point all under the chief command of General Haig, while the Bavarian Crown Prince directed the movements of the German forces. On October 20, 1914, the allied line stretched—a few miles to the northeast of Ypres—from Bixschoote to the crossroads a mile and a half northwest of Zonnebeke. The cavalry only were kept busy during this day, while the other forces were making elaborate preparations for the main drive. The great attack was delivered October 21, against the point of the salient between Zonnebeke and Besselaere. The allied line on the left was so much exposed that the Twenty-second Brigade was enfiladed by the Germans at the very beginning, and in the center the Germans pierced the line held by the Royal Scots Fusiliers, with the Yorkshires on the extreme right. The fierce assaults from both sides ended in a draw for this day.

On October 22, 1914, the fighting was most severe all day; but later in the day the most violent assault of all was made by the Germans upon the first Brigade on the left. There the trenches were held by the Camerons, north of Pilkem on the Langemarck—Bixschoote road. Here the Germans broke the line and succeeded in capturing part of the Camerons—the famous Red Tartans. Further south, the Royal Scots Fusiliers were obliged to give way. The Germans pressed hard in the vicinity of Hollebeke which point opened a clear road to Ypres; but here the allied forces stood their ground. Still farther south the Essex Regiment and the Lancashire Fusiliers fought savagely, but were driven back upon Armentierre when night fell.

BATTLE FRONT IN FLANDERS

Early Friday morning, October 23, 1914, the Allies made a desperate assault upon the trenches lost by the Camerons on the previous day. The fighting culminated in a savage bayonet attack which resulted in the recapture of these trenches by the British composed of the King's Royal Rifles, the Royal West Surrey Regiment and the Northamptons.

On October 24, 1914, the Germans advanced upon the allied extreme left; but were successfully repulsed between Zonnébeke and Poelcapelle. Later in the day the Germans renewed their attack and compelled the allied troops to retire some distance.

The advance on the allied left was continued on Sunday, October 25, 1914. Repeatedly the Germans succeeded in piercing the allied lines; but at one time, even though they had broken through, a momentary lack of reserves compelled them to retreat to avoid capture. A savage enveloping attack was made during the night, north of Zandvoorde, where again the Germans broke through the allied lines, but were unable to maintain their advantage through failure of reinforcements to come up in time. The Leicester Brigade were shelled out of their trenches and were obliged to fall back to the south of the River Lys.

During the following three days—October 26, 27, 28, 1914—artillery fire was resorted to and desultory fighting and skirmishes along the entire line resulted in no noteworthy advantage to either belligerent.

Thursday, October 29, 1914, opened with clear and bracing weather which promised to continue throughout the day. The German attack which had been preparing for the past three days now broke like an irresistible wave upon the salient of the Gheluvelt crossroads, where the British First Corps was stationed. The first division was driven back from its trenches and after that the line swayed forward and backward for hours, but by two o'clock in the afternoon the position remained unchanged.

With the coming of the dawn on October 30, 1914, the fighting was resumed with even more savage determination on both sides. The hottest engagement centered about the ridge of Zandvoorde. German artillery fire cleared the allied trenches, burying many

of the British soldiers alive under mountains of earth and débris. This forced the line to retreat a full mile to Klein Zillebeke to the north. The Kaiser witnessed this engagement and by his presence cheered the German soldiers on to the most desperate fighting.

On the following day October 31, 1914, the crisis came. The fighting began along the Menin-Ypres road early in the morning and advanced with great violence upon the village of Gheluvelt. The First and Third Brigades of the First Division were swept back and the First Coldstream Guards were wiped out as a unit. The whole division was driven back from Gheluvelt to the woods between Veldhoek and Hooze. The allied headquarters at Hooze were shelled. General Lomas was wounded and six of the staff officers were killed.

The Royal Fusiliers who desperately stuck to their trenches fighting savagely were cut off and destroyed. Out of a thousand but seventy soldiers remained. Between two and three o'clock there occurred the most desperate fighting seen in the battle of Ypres. At 2:30 o'clock in the afternoon the Allies recaptured Gheluvelt at the point of the bayonet and by evening the Allies had regained their position. Ypres had not been captured by the Germans by this time, but they had secured their position in all the suburbs of Ypres and had that city at their mercy, provided allied reinforcements ordered up did not obstruct their path.

The fighting still continued for part of November, 1914, but for the month of October no definite result was to be recorded.

At Ypres, on November 2, 1914, the Germans captured 2,300 English troops and many machine guns. Dixmude was stormed by the Germans on the 10th of November, and they crossed the Yser Canal, capturing the Allies position west of Langemark, also driving them out of St. Eloi. Snow and floods interfered with the fighting along the battle front. Ypres was bombarded on several occasions and was repeatedly set on fire.

November 11, 1914, was another day of severe fighting. At daybreak the Germans opened fire on the allied trenches to the

north and south of the road from Menin to Ypres. After a furious artillery fire the Germans drove their men forward in full force. This attack was carried out by the First and Fourth brigades of the Prussian Guard Corps which had been especially selected to capture Ypres if possible, since that task had proved too heavy for the infantry of the line. As the Germans surged forward they were met by a frontal fire from the allied lines, and as they were moving diagonally across part of the allied front, they were also attacked on the flank by the English artillery. Though the casualties of the Germans were enormous before they reached the English lines, such was their resolution and the momentum of the mass that, in spite of the splendid resistance of the English troops, the Germans succeeded in breaking through the allied lines in several places near the road. They penetrated some distance into the woods behind the English trenches, where some of the bloodiest fighting of the entire war took place.

On November 12, 1914, comparative quiet reigned and with the exception of artillery duels and some desultory fighting no results were obtained on either side. The British report makes this comment on this attempt upon Ypres: "Their (the Prussian Guard Corps') dogged perseverance in pursuance of their objective claims wholehearted admiration.

"The failure of one great attack, heralded as it was by an impassioned appeal to the troops made in the presence of the Emperor himself, but carried out by partially trained men, has been only the signal for another desperate effort in which the place of honor was assigned to the corps d'élite of the German army.

"It must be admitted that the Guard Corps has retained that reputation for courage and contempt of death which it earned in 1870, when Emperor William I, after the battle of Gravelotte, wrote: 'My Guard has formed its grave in front of St. Privat,' and the swarms of men who came up bravely to the British rifles in the woods around Ypres repeated the tactics of forty-four years ago, when their dense columns, toiling up the slopes of St. Privat, melted away under the fire of the French."

Ypres was now but a name. Nothing but a mass of ruins reminded the world of its previous quaint splendor. For Ypres had been rich in historic buildings and monuments of past days.

With the fall of Antwerp the Germans had made every effort to push forward a besieging force toward the west and had hastened to bring up a new army corps which had been hurriedly raised and trained, their object being to drive the Allies out of Belgium and break through to Dunkirk and Calais. Altogether they collected 250,000 fresh men. Eventually the Germans had north of La Bassée about fourteen corps and eight cavalry divisions, a force of 750,000 men, with which to attempt to drive the Allies into the sea. In addition there was immensely powerful armament and heavy siege artillery, which also had been brought up from around Antwerp. But in spite of these strong forces it became clearly evident by the middle of November that the attempt to break through to Calais had failed for the time being. The flooding of the Yser marks the end of the main struggle for Calais. The battle fronts had shifted. Between them there was a mile or two of mud and water. The Belgians had lost a quarter of their effectives. The Germans had evacuated the west bank of the Yser and were obliged to return to the point from which they had started.

CHAPTER XXVIII

ATTACKS ON LA BASSEE AND ARRAS

WHILE the engagement on the Yser was in progress in October, 1914, fierce fighting was kept up in the second section of the battle front, pivoting on Givenchy to the south and running east to the north of the La Bassée-Lille road. In this section the forces of the Crown Prince of Bavaria opposed the troops under the command of General Smith-Dorrien.

From October 1 to 3, 1914, considerable fighting went on in the flats east of Arras between Lens and the River Scarpe. This re-

sulted in the retirement of the Allies on the 4th. The Germans began to bombard Arras, keeping it up until the 6th, when their attempt to take the city next day was successfully repulsed. On October 8, the Germans, then holding Douai and Lens, were shelling Lille, then held by the British territorials. For the next two weeks artillery duels alternated with trench fighting and skirmishing.

The main attack at La Bassée covered fully ten days, lasting from October 22, 1914, to November 2, 1914. The first severe fighting came as has already been mentioned, on October 22, 1914. The British were driven out of the village of Violaines, which is situated on the road between Lorgies and Givenchy, and General Smith-Dorrien was compelled to retreat to the village of Faugissant, to the south of Lavantie.

On October 24, 1914, the Germans attacked heavily along the entire line, and the First Gordon Highlanders were driven out of their trenches. For three days the most savage fighting continued, resulting in the capture of Neuve Chapelle by the Germans on October 27, which was defended by the allied India troops. The fighting was desperate on both sides and became much confused, as units here and there had succeeded in breaking through their respective opponents' lines. All of this day and the next, October 28, this struggle continued, but the Germans maintained the ground they had won, forcing the allied forces to retire in order to re-form their lines.

On October 29, 1914, the Germans attacked at Festhubert, and gained several of the allied trenches after a severe struggle lasting throughout the day. Again the Germans maintained their new position, compelling the Indian troops to retire to the defense of the La Bassée gate, where they were joined by several British Brigades and the Second Corps Artillery.

October 30, 1914, was consumed in continuous artillery duels, which held the lines while the troops enjoyed much needed rest.

On October 31, 1914, the Indian forces were again savagely attacked by the Germans whose machine guns enfiladed them in their trenches. This attack has become noted for the great loss of British officers commanding the Hindus.

Concurrent with this fighting the Germans also made the most savage onslaughts further south, with the object of capturing Arras. The main attack against this important French city began on October 20, 1914, and lasted six days until the evening of October 26. The Germans in having possession of Lens had a great advantage, as they were thereby enabled to threaten the allied left center, which was stationed to the west of Lens; for, just south from the town, ran a railway which connected with the main line three miles east of Arras, called the Arras-Douai-Lille line. This gave the Germans a perfect system of lateral communications.

The German general, Von Bülow, commanding the Prussian Guard Corps led the attack on October 24, 1914, when he pushed his forces, fighting for every inch of the ground, to within gun range of the city of Arras. All day the most desperate fighting continued and had not General Maud'huy received the reinforcements which hurriedly came up just when needed the northern gates of Arras would have been gained by the Germans, who were held back in a position near enough, however, to subject Arras to another bombardment and the shell fire from this position rained upon Arras to the end of the month and some six days into November.

From the date of the entry of the French into Alsace on August 7, 1914, the battle front in France extended from the Swiss frontier, north through western Alsace thence in a northeasterly direction to a point where the line met the German forces advancing on Paris.

On October 1, 1914, this line had been consolidated into a battle front unbroken from Switzerland to the city of Douai in northeastern France. The Crown Prince of Bavaria commanded in the first section from Alsace to midway between Nancy and Verdun; the Crown Prince of Prussia directed the Verdun section reaching from west of Thiaucourt to Montfaucon; the Duke of Württemberg to Massiges; General von Hausen thence to Berydu-Bac; General von Bülow to a point directly north of Soissons; General von Kluck in a northwesterly direction to a point west of Noyon and onward to the north and northeast to Douai, which

is about fifteen miles northeast of Arras, from which point north the campaign has been described. This entire line was under the personal direction of General Joffre of the French Army; General Joffre's assignments to the various sections of this front were being continually changed, making it difficult to name the commanders in each section, except when some more or less noteworthy engagement had taken place along the line. The battle front here described did not materially change throughout the months of October, 1914, to February 1, 1915. Continual engagements took place along this entire front—a gain of a few yards here balanced by a loss of a like distance elsewhere.

Both belligerents had securely intrenched themselves. The pickax and spade were far more in use than the rifle, so that now cold weather coming on, the soldiers on both sides of the front were able to make the trenches quite comfortable. In many instances they laid down plank floors and lined the walls with boards, put up stoves, constructed sleeping bunks and tables, stools and benches, and even decorated the rooms thus evolved with anything suitable for the purpose. Pictures and photographs from home were the favorite decorations. All this was impossible for their brethren in the north and in Flanders, where the activities of the conflict subjected the soldiers to continual changes and removals.

The main objective of the Germans was the French fortresses Belfort, Epinal, Toul, and Verdun, for these obstructed the march to Paris. The continual onslaughts and counterassaults made upon this line left it practically unchanged during the month of October, 1914, in which time no noteworthy engagements worthy of the name "battle" occurred. The fighting in the north had been so desperate that it completely obscured the activities on the entire line to the south.

The net gains during the months of October and November, 1914, for either belligerent were practically nil. From Belfort in the south to Arras in the north the advance or retreat in any given section was but a matter of yards; a ridge, a farm, a hill, or other choice gun position, the farther bank of a rivulet or stream or canal occupied or captured—here by the French, there by the

Germans—generally proved to be but temporary possessions and wasted efforts.

It was incidents such as these that made up the record of events along this line. During all this time the military aeroplanes were busy dropping explosives upon the enemies lines, and extending their operations far to the rear circling above the larger towns and cities, doing considerable damage in many places. But this was not the only purpose of these daring sky pilots; for the principal object in flying over the adversary's country was to make observations and report movements of troops. In this respect the aeroplane had done immense service throughout the campaign.

CHAPTER XXIX

GENERAL MOVEMENTS ON THE FRENCH AND FLANDERS FRONTS

WE have seen that at the end of November, 1914, Ypres was still in the Allies' hands, though the Germans were exerting a fierce pressure in that region, and were gradually, even if very slowly, getting closer and closer to it.

At the beginning of December, 1914, the Germans drew their forces close up to Ypres, so closely in fact that they could bring into play their small, caliber howitzers, and before many hours Ypres was in flames in many places. The allied forces fought fiercely to compel the Germans to withdraw. Hand-to-hand fighting, bayonet charges, and general confusion was the order of the day. Thousands of men would creep out of their holes in the ground and crawl, availing themselves of whatever covering presented itself, to some vantage point and there stand up as one man and charge directly into the adversary's ranks.

All this was part of the general scheme worked out miles from the spot where the conflict was going on. There in some quaint little town occupying some out-of-the-way house—was the Gen-

eral Staff. The rooms were filled with officers; the walls were hung with large and small field and detail maps, upon which were plainly marked the name of every commanding officer and the forces under his command. Every detail of the armies' strength—names of the commanders, and any other detail such as topography was plainly in view.

It was here decided to turn the entire command of the allied forces along the Yser over to the British to avoid confusion. It was well that this was done just at this time, for on December 3, 1914, the Germans made a fierce onslaught along the entire front of thirteen miles between Ypres and Dixmude, bringing into use a great number of stanch rafts propelled by expert watermen, thus carrying thousands of the German forces over and along the Ypres River.

Again the belligerents came to a hand-to-hand conflict, and so well directed was the allied counterattack that no advantage to the Germans was obtained. For three days this severe fighting continued. The struggle was most sharp between Dixmude and the coast at Westende, where the Germans hoped to break through the allied lines, and thus crumple up their entire front, making a free passage.

On December 7, 1914, the French captured Vermelles, a minor village a few miles southwest of La Bassée. This little village had been the center of a continuous struggle for mastership for nearly two months. At last the French occupied this rather commanding point, important to the Allies, as it afforded an excellent view over a wide stretch of country occupied by the Germans.

The German Staff headquarters were removed from Roulers, which is about twelve miles distant from Ypres, on December 8, 1914, from the vicinity of Ypres, while their own forces had been concentrated upon Dixmude, twelve miles to the north. This town had suffered severely before, but the allied forces using what shelter they could improvise, were doing considerable damage from this point. Therefore the Germans began to bombard the place.

On December 9, 1914, the Germans succeeded in gaining

slightly toward Ypres. Farther north they were by this time also in a position to take Furnes under fire. This town lies on the frontier between Belgium and France, in the path of some of the most savage onslaughts on the part of the Germans to break through the allied lines in order to reach the channel towns of Dunkirk and Calais.

On December 10, 1914, the allied forces made an ineffectual attack on Roulers, which the German General Staff had just left. South of Ypres the allied forces made a severe attack upon the town of Armentieres, about eight miles from Ypres, but gained no permanent advantage.

During this time the Germans had also so far succeeded in consolidating their positions in the neighborhood of Ostend, that they could put their heavy guns in position near the shores of that famous watering place. This was a very necessary precaution to meet the attacks of English gunboats, and even larger cruisers that were patrolling that coast.

On December 12, 1914, the severest fighting was along the Yser Canal, which was crossed and recrossed several times.

On December 13, 1914, the Allies succeeded in repulsing the Germans on the River Lys, where for three days the Germans had inaugurated a hot offensive. These engagements were exact counterparts of the fighting at other points in Flanders, where both opponents were apparently well matched, and where advantages were won and lost in rapid succession.

There was severe fighting also on December 14, 1914, extending along the entire front in Flanders from Nieuport to below Ypres. In the north the Germans made severe onslaughts, all more or less held up or repulsed by the Belgians, French, and English. The fighting was hottest near Nieuport, where the Allies made some small temporary gains. Besides the three armies participating in the conflict, the British fleet also took part in bombarding the German coast positions. Three British barges equipped with naval machine guns entered the River Yser in order to cooperate in the fighting. These boats took the two villages Lombartzyde and St. Georges.

In this action some of the heaviest fighting was done by the

French marines. Some slight advantages were also gained by the Allies in the neighborhood of St. Eloi and Klein Zillebeke.

Following these minor successes, attack was made upon the German lines on the west side of Wytschaete, a village which the Germans had succeeded in holding during the great battle of Ypres. To the west of this village is a wood called the Petit Bois, and to the southwest is the Maedelsteed spur, an eminence on hilly ground. From both of these places the Germans covered the village, prepared to hold it against all comers.

Major Duncan, commanding the Scots, and Major Baird leading the Royal Highlanders, attacked the Petit Bois, and in the flare of terrible machine gun and rifle fire, carried a trench west of the woods, while the Gordon Highlanders advanced upon the spur, taking the first trench. They were, however, obliged to fall back to the position from which they had started, with no advantage gained. This engagement at Wytschaete gave a good illustration of the difficulty of fighting in heavy, winter ground, devoid of cover, and so water-logged that any speed in advance was next to impossible. Just prior to the battle the ground had thawed, and the soldiers sank deep into the mud at every step they took.

On December 15, 1914, the Germans attacked a little to the south of Ypres, but no definite result was obtained. On the following day the Allies replied by an onslaught at Dixmude with a similar result. The Germans attempted to turn and strike at Westende the next day.

Roulers was temporarily occupied by the Allies on December 18, 1914, and in another location, about twenty-five miles farther southwest, in the neighborhood of Givenchy, the Allies' Indian troops were put to the test. The attack was launched on the morning of the 19th.

The Lahore and the Meerut divisions both took part. The Meerut division succeeded in capturing a trench; but a little later on a counterattack, launched by the Germans, forced the Indians back. The Lahore division, including the First Highland Light Infantry and the Fourth Gurkhas, took two lines of the enemy's trenches with hardly any casualties. These captured trenches

were at once occupied, and when they were full to capacity, the Germans exploded the previously prepared mines, and blew up the entire Hindu force.

At daylight on the morning of December 20, 1914, the Germans commenced a heavy artillery fire along the entire front. This was followed by an infantry charge along the entire line between Givenchy and La Quinque Rue to the north. The defense of Givenchy was in the hands of the India Sirhind Brigade, under General Bruner. At ten o'clock the Sirhinds became confused and fled, enabling the Germans to capture Givenchy. The Fifty-seventh Rifles and the Ninth Bhopals were stationed north of La Bassée Canal and east of Givenchy, and the Connaught Rangers were waiting at the south of the canal. The Forty-seventh Sikhs were sent to support the Sirhind Brigade, with the First Manchesters, the Fourth Suffolks, and two battalions of French Provincials, the entire force being under command of General Carnegie. All these mixed forces now essayed a combined counterattack in order to recover the ground lost by the Sirhind Brigade, but this failed.

The Allies called up reserves and re-formed the remnants resulting from that day's reverses. With the Seventh Dragoon Guards under the command of Lieutenant Colonel Lemprière, they began another attack. This, too, failed. When the Sirhind Brigade fell back, the Seaforth Highlanders were left entirely exposed. The Fifty-eighth Rifles went to the support of their left. Throughout the entire afternoon the Seaforths had made strenuous efforts to capture the German trenches to the right and left of their position. Upon the arrival of the Fifty-eighth the fighting redoubled in ferocity, but no advance was made. Finally word was given to retreat. The Allies lost heavily in killed, wounded, and prisoners.

The First Brigade was detached, and by midnight it had reached Bethune, about five miles west of Givenchy. Sir Douglas Haig was ordered to move also, the entire First Division in support of the exhausted Indian troops.

Action was begun on December 20, 1914, early in the afternoon by a simultaneous attack, and was continued until nightfall

without important results. The next morning General Haig in person took the command, but little ground was gained.

While this contest was in progress around Givenchy, the Germans took possession of the city of Arras, ten miles to the south.

Between December 23 and 30, 1914, the Belgian Army, strongly reenforced by French troops, began a series of violent attacks upon the German lines; but the Germans replied by a ceaseless bombardment of Nieuport, which is about a mile inland. No results of importance were obtained on either side.

The last week of December, 1914, bore a relieving holiday aspect, for it seemed as though by general consent the carnival of blood was to be considered not consonant with the solemnity of the season. But for all that the French succeeded in blowing up some German trenches with a new howitzer they were anxious to try out, and the Belgian-French forces retook St. Georges in northern Flanders.

St. Georges had been held by the Germans for some time; the village stands on the right hand of the Yser, and it was the only position they retained on that side of the river. It seems from the very ease with which the village was taken that the Germans felt their position there untenable, and withdrew to their own side of the river in order to enjoy a quiet Christmas with their comrades, whose singing of Christmas songs was forever being wafted over that river of blood. Although the general action continued on both sides, no serious battles are to recorded in Flanders for the balance of the year 1914.

CHAPTER XXX

OPERATIONS AROUND LA BASSEE AND
GIVENCHY

ON the whole, the results obtained during the first days of 1915 on the Belgian battlefront favored the Germans. Of this front the Belgians held but three miles more or less, and the British were defending a line of about twenty miles, while the French covered the balance of about twelve miles, all of which included, about the entire front in Flanders from the dunes at Nieuport on the Channel to Armentiers in the south, a line—by no means straight—about thirty-five miles in length.

Activities along the extended front in the Champagne district having proved successful for the German forces to a considerable extent, the General Staff turned its attention now to La Bassée region.

There was good tactical reason for this move, because the British were seriously threatening the position, straddling La Bassée Canal where it flows between Cuinchy and Givenchy, and there was danger that they might capture La Bassée, where the Germans held a salient of considerable strategical importance, as it covered their line of communication to the south.

Previous successful operations by the British at Richebourg and Festubert north of Givenchy, and at Vermelles, south of Cuinchy, evidently prompted the Germans to attempt a counter-attack. Besides it was desirable for the Germans to test the strength of the Allies at this point, and to do this with some measure of success, the Germans massed a considerable force for this purpose.

Beginning about January 14, 1915, the British met with varying and minor successes and defeats in this region, but no noteworthy action had taken place for upward of ten days, until January 25, under the eye of the German Kaiser, the principal attack, which had been carefully planned, took place.

On the morning of January 25, 1915, a demonstration along

the front from Festubert to Vermelles and as far north as Ypres and Pervyse was inaugurated. The Germans began to shell Bethune, which was within the allied lines about eight or nine miles west of La Bassée. An hour later, in the neighborhood of nine o'clock, following up heavy artillery fire, the Fifty-sixth Prussian Infantry and the Seventh Pioneers advanced south of the canal, which runs eastward from Bethune, where the British line formed a salient from the canal forward to the railway near Cuinchy, and thence back to the Bethune and La Bassée road where the British joined the French forces.

This salient was occupied by the Scots and the Coldstream Guards. The Germans were obliged to advance by the road, as the fields were too soft for the passage of the troops; even the roads were in a terrible condition, deep ruts and thick sticky mud greatly retarding the onward march of the German forces. But the Allies fared little better in this respect. In fact the entire engagement was fought out in a veritable sea of mud and slush.

Well-directed artillery fire by the Germans blew up the British trenches in this salient, and the Germans at once penetrated the unsupported British line. The Germans also had the advantage of an armored train, which they ran along the tracks from La Bassée almost into Bethune, sufficiently close to throw considerable shell fire into this town.

The Germans advanced in close formation, throwing hand grenades wherever they could with the best advantage. They came on so rapidly that the Guards were obliged to resort to the bayonet, but on the Germans pressed with a momentum that the British in many cases had no time to withdraw the bayonet from the body of an antagonist before he found himself put out of action.

At some points the distance between the trenches was so small that it was utterly impossible to stop the onrush from one trench to the other. The Germans swept and broke through the British lines, treading their fallen opponents under foot as they advanced. At this point the British turned and fled, as there was no hope of successful resistance.

As the great momentum forced the German advance through

the allied lines into the open field beyond and was joined by a heavy column, which had debouched from the vicinity of Auchy, British guns opened a murderous fire and inflicted terrible slaughter upon these ranks.

The Coldstream and the Scots' Guards retreated to their second line of defense, where they joined others of their command held in reserve there. Once again they turned to meet the oncoming Germans, and again were forced to give way, leaving the Germans in possession of all the ground previously gained. The remnants of the Guards retreated until they were met by the London-Scottish regiment sent to reenforce them. Here they halted while a counterattack was being organized by the First Royal Highlanders, part of the Camerons, and the Second King's Rifle Corps which also came up.

At one o'clock on January 25, 1915, and with the cooperation of the French on their right, this rapidly improvised force moved forward, making unobstructed progress on their wings by the canal and the road. For some reason their center was delayed and held back. When they did finally arrive and pressed forward to meet the German forces, who stood at attention awaiting the next move of the Allies, and who now came on with a rush, the impact was fearful, and the casualties on both sides enormous; but no gains were made by the Allies, and the Germans held the ground they had won. At the height of the battle the Second Royal Sussex rushed into the fray in support of their hard-pressed comrades, but all to no purpose, for these as the others were forced back to the rear of their starting point with but a fraction of their forces remaining to report the events of the day.

While this terrible slaughter was in progress, the French left on the other side of La Bassée road, which separated the Allies at this point, had been attacked by the right of the German line, and driven back to a considerable distance, but not as far back as the British, so that the French left was in advance of the British right and badly exposed to flank attack from the northward.

This obliged the entire allied forces to retreat some distance farther to the rear, and as night came on and the severity of the

action had ceased, the Allies had an opportunity to realign their positions and somewhat strengthen the same by the First Guard Brigade which now came up, showing the terrible suffering to which they had been subjected. Finally, however, it was found advisable to withdraw the First altogether and replace them by the First Infantry Brigade.

Now the German strategical plan became clear. It was to force the British to concentrate on the exposed line between Festhubert and Givenchy, north of the canal, and then to turn the British right by the German forces in their new position just south of the canal, thus calling for simultaneous action on both sides of the canal.

The Germans delivered an equally severe attack upon the allied position in the village of Givenchy, about a mile north of the canal, which bounded the scene of the attack just described. As in the other attack, the Germans opened action by severe artillery fire, using high-explosive shells, and after due preparation, at about 8.15 in the morning, the infantry advanced as is customary with the Germans, in close formation. The British met this advance by somewhat weak artillery fire, which, it was afterward explained was due to continued interruption of the telephonic communications between the observers and the batteries in the fight. However, as it was, this fire, added to the machine gun and rifle fire from the trenches, served to turn the German advance from their original direction, with the result that they crowded together in the northeast corner of Givenchy after passing over the first-line trenches of the Allies front. Their momentum carried the Germans far into the center of the village, with remarkably few casualties considering the murderous fire to which they had been subjected throughout their impetuous advances.

In the village of Givenchy, however, the Second Welsh Regiment and the First South Wales Borderers, which had been stationed there and held in reserve, gave the Germans a warm reception, and when the First Royal Highlanders came up they delivered a fierce counterattack. In this they were supported by the fire of the French artillery, which assistance, however,

proved costly to the Allies, as the French fire and bursting shells killed friend and foe alike. Street fighting became savage, amid the explosions of shells sent to enliven the occasion by the French. This concluded the action for the day and when the smoke cleared away both sides found their position comparatively little changed and nothing but the thinned ranks of the combatants reminded the observer that the most severe kind of fighting had taken place for the best part of a day.

The following day, January 26, 1915, the action was resumed, and the attack opened along the Bethune and La Bassée road. This soon died out, as though by general consent, each side re-occupying their position of the previous evening.

But on Friday, January 29, 1915, early in the morning, the Germans again opened with severe artillery fire which directed its attention particularly to the British line, where the First Army Corps lay between La Bassée Canal and the Bethune road near Cutchy. After an hour's shelling the Germans sent one battalion of the Fourteenth Corps toward the keep carrying scaling ladders, and two battalions of the same Corps were sent to the north and south of this keep. Now upon this keep and to the north of it stood the Sussex Regiment and to the south of it the Northamptonshire regiment. The attack was severe, but the defense was equal to it and the net results were summed up in the casualty lists on both sides. An attack upon the French, south of Bethune, on the same day met with like results. The great German objective was to open another road to Dunkirk and Calais, and had they been successful in the engagements of the past few days it is probable that they would have succeeded.

To the north in the coast district the Belgians had succeeded in flooding a vast area, which served for the time to separate the combatants for a considerable distance, obliging the Germans to resort to rafts, boats and other floating apparatus to carry on a somewhat haphazard offensive and resulting in nothing more than a change from gunfire slaughter to drowning. The immense inconvenience attendant to this mode of warfare decided the Germans to drain this area and they succeeded in doing this by the end of January, 1915.

On the other hand the Belgians captured two German trenches in the north on January 17, 1915, and the British sent a force to attack Lille on January 18. The Belgian trenches were re-occupied by the Germans and the Lille attack was successfully repulsed.

Then, for a week, there was nothing of importance until January 23, 1915, when the Germans made a strong attack upon Ypres which was repulsed. On January 24 the Germans re-captured St. Georges and bombarded a few of the towns and villages harboring allied troops.

-The Belgians continued in their endeavor to flood the German position along the Yser, on January 25, 1915, and succeeded in obliging their opponents to vacate for a time at least, and on the last day of January allied forces consisting of Zouaves, Gurkhas and other Indian companies made an attack upon the German trenches upon the dunes at Lombaertzyde, gaining a temporary advantage at an expense of considerable loss in casualties.

In reviewing the activities during the month of January, 1915, the disagreeable state of the weather must be taken into consideration; this resulted in terrible suffering, to which the battling forces were subjected during the actual fighting and even more so while at rest, either on the open field or in the questionable comfort of an inhospitable and leaky trench.

While every effort was made by the respective General Staffs to supply their fighting troops with such comforts as were absolutely necessary to keep body and soul together and in trim for the next day's work, little could be accomplished and it is a marvel how these poor soldiers did withstand the rigorous weather which blighted the prospect of victory, so dear to all who wear a uniform.

CHAPTER XXXI

END OF SIX MONTHS' FIGHTING IN THE
WEST

THERE were few military movements on the French battle front during December, 1914, along the Aisne, the Oise and in the northern Champagne. The fighting was mostly artillery duels and skirmishes by separate units. In the Argonne, however, the Crown Prince of Germany was active and there, as well as along the Moselle and on the heights of the Vosges, many engagements were fought out resulting in varying advantages to either opponent. Both sides had been strongly intrenched and the ground was covered by snow to great depths, making progress impossible except upon skis and snowshoes.

On December 3, 1914, the French captured Burnhaupt, a hill east of Muelhausen in Upper Alsace, only to give up their advantage after a German counterattack. On December 16 the Germans attacked in the Woivre region and in Alsace; but were repulsed the following day. On December 31, 1914, the French attacked Steinbach in Alsace, but were driven out again.

The New Year of 1915 opened gently along the battle front in France below Arras. The first large movement in 1915 began on January 8, at Soissons. This city lies on both banks of the river Aisne and was in the possession of the French. The French forces attacked during a drenching rain, pushing up the rising ground to the north with their heavy guns, regardless of the soft ground which rapidly turned to deep mud and slush. They succeeded in carrying the first line of German trenches on a front a mile wide, thus gaining the top of the hill, which gave them an excellent position for their artillery. The next day the Germans counterattacked, but failed to dislodge the French.

Nothing occurred on Sunday, January 10, 1915, but on Monday, about noon, January 11, the Germans came on with great force. The delay on the part of the Germans was due to their awaiting reinforcements then on the road to Soissons. For four

days there had been a steady downpour of rain which had not even stopped at this time. The river Aisne was much swollen and some of the bridges had been carried away, cutting off all supplies for the French, who were slowly giving way but fighting desperately.

On January 12, 1915, and on the 13th the French were driven down the slopes in a great rush. This predicament was a terrible one—the onrushing Germans 500 feet in front of them and the swollen river making successful retreat impossible, with the ground between almost impassable with mud and slush. French reserves had improvised a pontoon bridge across the Aisne at Missy, in the rear of their now precarious position. This bridge was just strong enough to carry the men and ammunition; but not the heavy guns. The retreat turned into a rout—a general stampede for the bridge and river.

The slaughter was terrible, the river swollen as it was seemed choked with floating soldiers. The few who safely got across the bridge and those who were successful in reaching the farther bank of the Aisne alive, reached Soissons eventually. The German gain in prisoners and booty was enormous and their gain in ground advanced their line a full mile, on a front extending five miles to Missy and a little beyond. The Germans strongly intrenched their new position without loss of time.

Farther along this front, in the neighborhood of Perthes, a less important engagement took place. The Germans, under General von Einem, opposed General Lelangle and his French forces. The results of this engagement were negligible.

On January 18, 1915, a savage attack by the Germans was successfully repulsed at Tracy-le-Val and on the 19th the French made an assault upon the German position at St. Mihiel, in the Verdun section without gaining any ground. Farther north on this section the French pressed on and gained a little ground near the German fortress Metz; but the very vicinity of this fortress counterbalanced this gain.

On January 21, 1915, the Germans recaptured the Le Pretre woods near St. Mihiel, and next day the belligerents fought a fierce engagement in the Vosges without advantage to either side.

Prince Eitel, the second son of the Kaiser, commanded an attack upon Thann in Alsace on January 25, 1915, but was repulsed by the French defenders.

On January 28, 1915, the Germans made some gains in the Vosges and in Upper Alsace, but in their attempt to cross the river Aisne on the 29th they were unsuccessful.

January 30, 1915, brought some successes to the Germans in the Argonne forest, where throughout the month the most savage fighting was going on in thick underbrush and from tree tops.

PART II—NAVAL OPERATIONS

CHAPTER XXXII

STRENGTH OF THE RIVAL NAVIES

SEA fights, sea raids, and the hourly expectation of a great naval battle—a struggle for the control of the seas between modern armadas—held the attention of the world during the first six months of the Great War. These, with the adventures of the *Emden* in the waters of the Far East, the first naval fight off Helgoland, the fight off the western coast of South America, the sinking of the *Lusitania*, and the exploits of the submarines—held the world in constant expectancy and threatened to involve neutral nations, thus causing a collapse of world trade and dragging all the peoples of the earth into the maelstrom of war.

This chapter will review the navies as they gather for action. It will follow them through the tense moments on shipboard—the days of watching and waiting like huge sea dogs tugging at the leash. Interspersed are heroic adventures which have added new tales of valor to the epics of the sea.

The naval history of the great European conflict begins, not with the first of the series of declarations of war, but with the preliminary preparations. The appointment of Admiral von Tirpitz as Secretary of State in Germany in 1898 is the first decisive movement. It was in that year that the first rival to England as mistress of the world's seas, since the days of the Spanish Armada, peeped over the horizon. Two years before the beginning of the present century, Von Tirpitz organized a campaign, the object of which was to make Ger-

many's naval as strong as her military arm. A law passed at that time created the present German fleet; supplementary laws passed in 1900 and 1906 through the Reichstag by this former plowboy, caused the German navy to be taken seriously, not only by Germans but by the rest of the world. England, jealous of her sea power, then began her maintenance of two ships for each one of her rival's. Germany answered by laying more keels, till the ratio stood three to two, instead of two to one.

Two years before the firing of the pistol shot at Sarajevo, which precipitated the Great War, the British admiralty announced that henceforth the British naval base in the Mediterranean would be Gibraltar instead of Malta. Conjectures were made as to the significance of this move; it might have meant that England had found the pace too great and had deliberately decided to abandon her dominance of the eastern Mediterranean; or that Gibraltar had been secretly reequipped as a naval base. What it did mean was learned when the French Minister of Marine announced in the following September that the entire naval strength of France would thereafter be concentrated in the Mediterranean. This was the first concrete action of the *entente cordiale*—the British navy, in the event of war, was to guard the British home waters and the northern ports of France; the French navy was to guard the Mediterranean, protecting French ports as well as French and British shipping from "the Gib" to the Suez.

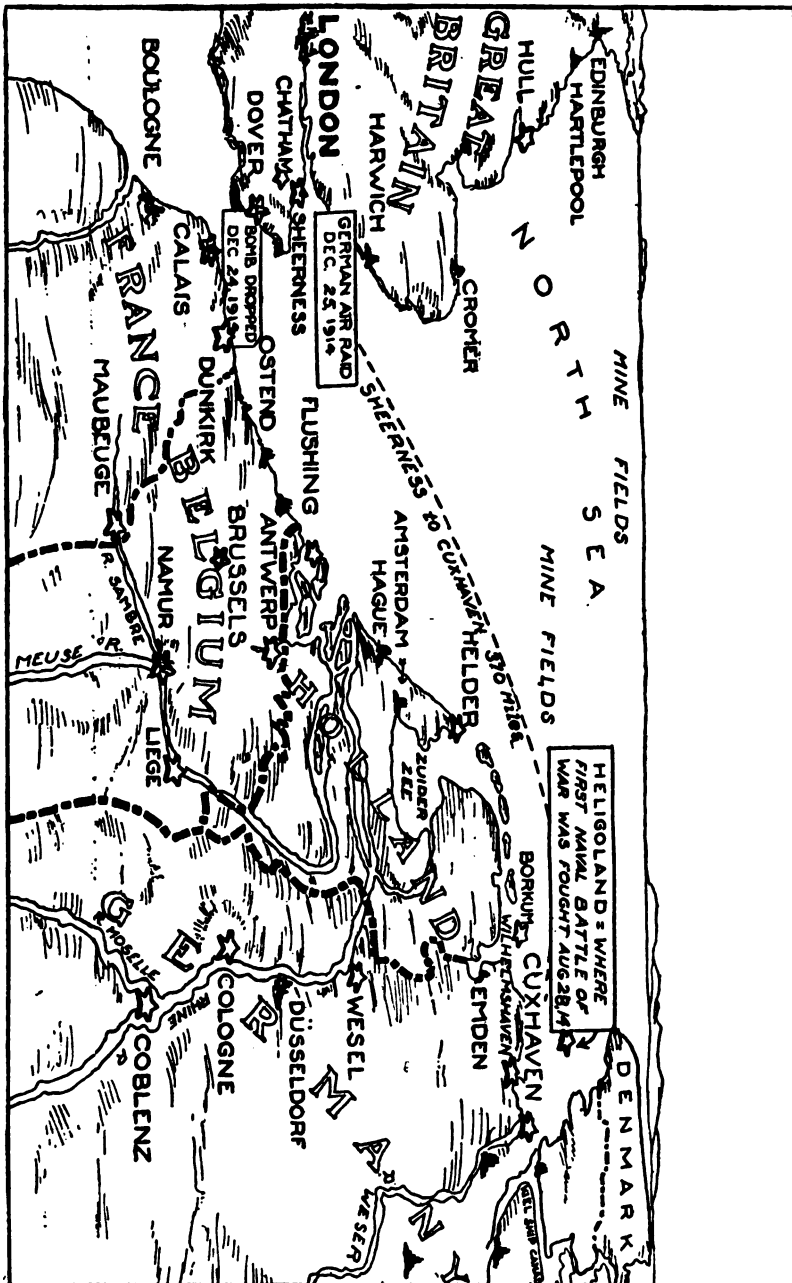

What was the comparative strength of these naval combinations when the war started?

From her latest superdreadnoughts down to her auxiliary ships, such as those used for hospital purposes, oil carrying and repairing, England had a total of 674 vessels. Without consideration of ages and types this total means nothing, and it is therefore necessary to examine her naval strength in detail. She had ten battleships of 14,000 tons displacement each, built between 1895 and 1898—the *Magnificent*, *Majestic*, *Prince George*, *Jupiter*, *Cæsar*, *Mars*, *Illustrious*, *Hannibal*, and *Victorious*—with engines developing 12,000 horsepower that sent them through the water at 17.5 knots, protected with from nine

to fourteen inches of armor, and prepared to inflict damage on an enemy with torpedoes shot from under and above the water, and with four 12-inch guns, twelve 6-inch guns, sixteen 3-inch guns, and twenty guns of smaller caliber but of quicker firing possibilities.

Her next class was that of the *Canopus*—the *Goliath*, *Vengeance*, *Ocean*, *Albion*, and *Glory*—2,000 tons lighter than the first class named above, but more modern in equipment and construction, having been built between the years 1900 and 1902. Their motive power was heavier, being 13,500 horsepower, and their speed was almost a knot faster. Increase in the power of naval guns had made unnecessary any increase in the thickness of their armor, and consequently ranged from 6 to 12 inches in thickness. Their armament was about the same as that of the older class, but each carried two more torpedo tubes.

Discussion in naval circles throughout the world turned then to the question of whether it were better to build heavier ships with heavier armament, or to build lighter and faster ships designed to "hit and get away." The British authorities inclined toward the former view, and between 1901 and 1904 the British navy was augmented with the *Implacable*, *London*, *Bulwark*, *Formidable*, *Venerable*, *Queen*, *Irresistible*, and *Prince of Wales*—each of the heretofore unheard-of displacement of 15,000 tons. In spite of their size they were comparatively fast, having an average speed of 18 knots; they did not need, and were not equipped with heavier armor, having plates as thin as 3 inches and as thick as 12. They were built to "take punishment," and therefore they had no greater armament than the vessels previously named. The naval program of 1903 and 1904 also included the *Duncan*, *Albemarle*, *Russell*, *Cornwallis*, and *Exmouth*, each 1,000 tons lighter than the ships of the *Implacable* type, but with the same equipment, defensive and offensive, and of the same speed. And in the same program, as if to offset the argument for heavier and stronger ships, there were included the lighter and faster ships, *Swiftsure* and *Triumph*, displacing only 11,500 tons, but making 19 knots. Their speed permitted and necessitated lighter armor—10 inches through at the thick-

GERMAN AND ENGLISH NAVAL POSITIONS

set points—and their armament was also of a lighter type, for their four largest guns were capable of firing 10-inch shells.

Germany was becoming a naval rival worthy of notice, and the insular position of England came to be a matter of serious concern by 1906. Britain has never considered the building of land forts for her protection—her strength has always been concentrated in floating war machines. She now began to build veritable floating forts, ships of 16,350 tons displacement. By the end of 1906 she had ready to give battle eight ships of this class, the *King Edward VII*, *Commonwealth*, *Dominion*, *Hindustan*, *Africa*, *Hibernia*, *Zealandia*, and *Britannia*. Speed was not sacrificed to weight, for they were given a speed of 18.5 knots, developed by engines of 18,000 horsepower. Their thinnest armor measured 6 inches, and their heavy guns were protected with plates 12 inches thick. The 12-inch gun was still the heaviest piece of armament in the British navy, and these eight ships each carried four of that measurement, as well as four 9.2-inch guns, ten 6-inch guns, fourteen rapid-fire guns of 3 inches, two machine guns, and four torpedo tubes.

Now that it was seen that ships of enormous displacement could also be swift, England committed herself to the building of ships of even greater size. In 1907 came the first of the modern dreadnoughts, so-called from the name which was given to the original ship of 17,900 tons displacement. The *Dreadnought* made the marvelous speed (for a ship of that size) of 21 knots, which she was enabled to do with turbine engines of 23,000 horsepower. Her armor measured from 8 to 11 inches in thickness, and her great size enabled her to carry as high as ten 12-inch guns. Her minor batteries were strong in proportion.

Then, as if taking her breath after a stupendous effort, England in the following year built two ships of 16,000 tons displacement, the *Lord Nelson* and the *Agamemnon*, with speed, armor, and armament much lower than those of the *Dreadnought*. But having taken a rest, Britain was again to make a great effort, launching in 1909 the *Temeraire*, *Superb*, and *Bellerophon*, monsters displacing 18,600 tons. With engines of 23,000 horsepower that could drive them through the seas at 21 knots, ready

to ward off blows with armor from 8 to 11 inches thick, firing at the same time volleys from ten 12-inch guns down to sixteen 4-inch rapid firers.

Naval architecture had now taken a definite turn, the principal feature of which was the tremendous size of the destructive floating machines. England, a leader in this sort of building, in 1910 built the *Vanguard*, *Collingwood*, and *St. Vincent*, each displacing 19,250 tons. Nor were they lacking in speed, for they made, on an average, 21 knots. The 20,000-ton battleship was then a matter of months only, and it came in the following year, when the *Colossus*, *Hercules*, and *Neptune* were launched. It was only in the matter of displacement that these three ships showed any difference from those of the *Vanguard* class; there were no great innovations either in armament or armor. But in the same year, 1911, there were launched the *Thunderer*, *Monarch*, *Orion*, and *Conqueror*, each of 22,500 tons, and equipped with armor from 8 to 12 inches thick, for the days of 3-inch armor on first-class warships had gone forever. These had a speed of 21 knots, and were the first British ships to have anything greater than a 12-inch gun. They carried as a primary battery ten 13.5-inch guns, and sixteen 4-inch guns, along with six more of small caliber as their secondary battery.

In 1912 and 1913 there was only one type of warship launched having 23,000 tons displacement with 31,000 horsepower, a half a knot faster than previous dreadnoughts, and carrying, like the previous class, ten 13.5-inch guns, along with some of smaller caliber. The ships of this class were the *King George V*, *Ajax*, *Audacious*, and *Centurion*.

The year 1914 saw even more terrible machines of death launched. Two types were put into the water, the first that of the *Iron Duke* class, of which the other members were the *Benbow*, *Emperor of India*, and *Marlborough*. They showed great improvement in every point; their speed was 22.5 knots, their displacement 25,000 tons, and their torpedo tubes five. Like their immediate predecessors, they carried a primary battery of ten 13.5-inch guns, along with the smaller ones, and their armor measured from 8 to 12 inches in thickness. The second

type of the year was that of the *Queen Elizabeth* and *Warspite* class. They surpassed all the warships when they were built. Their speed for their size was the greatest—25 knots. They had the largest displacement among warships—27,500 tons; they had the thickest armor, ranging from 8 to 13.5 inches; they had the most improved form of engines—oil burners, developing 58,000 horsepower; and most marvelous of all was their primary battery, which consisted of eight 15-inch guns. The largest gun yet made had been the 16-inch gun, for use in permanent position in land forts, and, with the German army, for a mobile force. It now was shown that the modern warship could carry a gun as heavy as any on land. There were in the course of construction when the war broke out eight more such monsters, the *Malaya*, *Valiant*, and *Barham*, sister ships of the *Queen Elizabeth*, and the *Royal Oak*, *Resolution*, *Royal Monarch*, *Ramillies*, and *Renown*, each of 29,000 tons displacement, but having the same armament as the *Queen Elizabeth*. All of these were hastened to completion as soon as war was declared.

At the time of the declaration of war England had, in addition to these greatest ships, a number of supporting ships such as the ten battle cruisers, *Indomitable*, *Invincible*, *Indefatigable*, *Inflexible*, *Australia*, *New Zealand*, *Queen Mary*, *Princess Royal*, *Lion*, and the *Tiger*. Their displacements ranged from 17,250 to 28,000 tons, and their speeds from 25 to 30 knots, the last being that of the *Tiger*. Their speed is their greatest feature, for their armament and batteries are much lighter than those of the first-line ships.

Next, there were ready thirty-four high-speed cruisers of quite light armament and armor. There were six of the *Cressy* type, four of the *Drake* type, nine of the same type as the *Kent*, six of the same class as the *Antrim*, six like the *Black Prince*, three of the same class as the *Shannon*, together with seventeen heavily protected cruisers, of which the *Edgar* was the prototype. The rest of the British navy needs no detailed consideration. It consisted at the outbreak of the war of 70 protected light cruisers, 134 destroyers, and a number of merchant ships convertible into war vessels, together with submarines and other small ships.

The navy of France stood fourth in the list of those of the world powers at the time the war started. There were eighteen old vessels, built between 1894 and 1909, including the *Carnot* class (corresponding to the British ship *Magnificent*), the *Charlemagne*, *Bouvet*, *Suffren*, *République*, and *Democratie* classes. The most modern of these types displaced no more than 14,000 tons, made no more than 18 knots, and carried primary batteries of 12-inch guns.

Some improvement was made in the six ships of the *Danton* class which were built in 1911 and 1912. They displaced 18,000 tons, had armor from 9 to 12 inches thick and carried guns as high as 12 inches at the mouth. They correspond to the British ship *Temeraire*. In 1913 and 1914 were launched the *Jean Bart*, *Courbet*, *Paris*, and *France* of the dreadnought type, but much slower and not so heavily armed as the British ships of the same class. In eight ships which were incomplete when war was declared the matter of speed received greater attention, and they are consequently faster than the older vessels of the same type. It is in the nineteen French armored cruisers—France has no battle cruisers—that the French showed better efforts as builders of speedy ships, for they made 23 knots or more. In the list of French fighting ships there are in addition two protected cruisers, the *D'Entrecasteaux* and the *Guichen*, together with ten light cruisers. But the French "mosquito fleet," consisting of destroyers, torpedo boats, and submarines is comparatively large. Of these she had 84, 135, and 78, respectively.

After the Russo-Japanese War the battle fleets of Russia were entirely dissipated, so that when the present conflict came she had no ships which might have been accounted worthy aids to the navies of England and France. In so far as is known, her heaviest ships were the *Andreas Perozvanni* and the *Imperator Pavel I*, each displacing only 17,200 tons, and of the design of 1911.

Against these fighting naval forces of the allied powers were ranged the navies of Germany and Austria-Hungary. The former had, at the outbreak of hostilities, 36 battleships, 5 battle cruisers, 9 armored cruisers, and 43 cruisers. Instead of giving

attention to torpedo boats she gave it to destroyers, of which she had 130. And of submarines she had 27.

In detail her naval forces consisted, first, of the *Kaiser Friedrich III*, *Kaiser Karl der Grosse*, *Kaiser Barbarossa*, *Kaiser Wilhelm II*, and *Kaiser Wilhelm der Grosse*, all built as a result of the first agitation of Von Tirpitz, between the years 1898 and 1901. They each displaced 10,614 tons, had a speed of 18 knots, required 13,000 horsepower, were protected with from 10 to 12 inches of armor, and carried four 9.4-inch guns, fourteen of 5.9 inches, twelve of 3.4-inches, and twenty of smaller measurement. Roughly they corresponded to the British ships of the *Canopus* class, both in design and time of launching.

Following this class came that of the *Wittelsbach*, including also the *Wettin*, *Zähringen*, *Mecklenburg*, and *Schwaben*, built between 1901 and 1903, displacing 11,643 tons, making 18 knots, protected with from 9 to 10 inches of armor and carrying a primary battery of four 9.4-inch guns, eighteen 5.9-inch guns, and a large secondary battery. The similar type in the British navy was the *Canopus*—for England was far ahead of Germany, both in the matter of displacement and primary battery. During the same years England had launched ships of the type of the *Implacable*.

In 1904 came the German ships *Hessen*, *Elsass*, and *Braunschweig*, and in 1905 and 1906 the *Preussen* and *Lothringen*. They were well behind the English ships of the same years, for they displaced only 12,097 tons, made 18 knots, carried armor of from 9 to 10 inches in thickness, and a primary battery of four 11-inch guns, fourteen 6.7-inch guns, and twelve 3.4-inch guns, together with rapid firers and other guns in a secondary battery. England at this time was putting 12-inch guns in the primary battery of such ships as the *King Edward VII*.

Still Germany kept up the race, and in 1906, 1907, and 1908 launched the *Hannover*, *Deutschland*, *Schlesien*, *Schleswig-Holstein*, and *Pommern*, with 12,997 tons displacement, 16,000 horsepower, a speed of 18 knots, and only 11-inch guns in the primary batteries. Whereas England, at the same time, was building ships of the dreadnought type.

Next came four ships of the *Vanguard* class—the *Westfalen*, *Nassau*, *Rheinland*, and *Posen*, built in 1909 and 1910. Their heaviest guns measured 11 inches, while those of the English ships of the same class measured 12 inches. The displacement of these German fighting ships was 18,600 tons. In point of speed they showed some improvement over the older German ships, making 19.5 knots. Germany, like England, was now committed to the building of larger and larger ships of the line. The *Helgoland*, *Thüringen*, *Oldenburg*, and *Ostfriesland*, which were put into the water in 1911 and 1912, were consequently of 22,400 tons displacement, with a speed of 20.5 knots and carrying twelve 12-inch guns, fourteen 5.9-inch rapid-fire guns, fourteen 3.9-inch rapid-fire guns, a few smaller guns, and as many as six torpedo tubes.

While England was maintaining her "two to three" policy, and while the United States stood committed to the building of two first-class battleships a year, Germany, in 1913, put five of them into the water. These were the *König Albert*, *Prinz Regent Luitpold*, *Kaiserin*, *Kaiser*, and *Friedrich der Grosse*, each capable of speeding through the water at a rate of 21 knots, displacing 23,310 tons and carrying an armament of ten 12-inch guns, fourteen 5.9-inch guns, and a large number of rapid-fire guns of smaller measurement. Their armor was quite heavy, being 13 inches thick on the side and 11 inches thick where protection for the big guns was needed.

The largest ships in the German navy which were launched, fitted, and manned at the time that the war began, were those which were built in 1914 and which had a displacement of 26,575 tons. These ships were the *König*, *Grosser Kurfürst*, and the *Markgraf*. The corresponding type in the British navy was that of the *Iron Duke*, built in the same year. The British ships of this class were 1,000 tons lighter in displacement, a bit faster—making 22.5 knots to the 22 knots made by the German ships—and their armament was not so strong as that of the German type, for the German ships carried ten 14-inch guns, whereas the English carried ten 13.5-inch guns.

In addition to these first-class battleships, Germany had cer-

tain others, individual in type, such as the *Von der Tann*, *Moltke*, *Goeben*, *Seydlitz*, *Derfflinger*, *Fürst Bismarck*, *Prinz Heinrich*, *Prinz Adalbert*, *Roon* and *Yorck*, *Scharnhorst* and *Gneisenau*, *Blücher*, *Magdeburg*, *Strassburg*, *Breslau*, *Stralsund*, *Rostock*, and *Karlsruhe*. These may be reckoned as scout cruisers, for they showed much speed, the fastest making 30 knots and the slowest 19 knots. The oldest dates from 1900, and the newest from 1914. Germany had, also, thirty-nine more fast protected cruisers which were designed for scout duty.

In destroyers she was well equipped, having 143 ready for service when war was declared. Her twenty-seven submarines were of the most improved type, and much about their construction and armament she was able to keep secret from the rest of the world. It is probable that even their number was greater than the intelligence departments of foreign navies suspected. The best type had a speed on the surface of 18 knots and could travel at 12 knots when submerged. The type known as *E-21*, of the design of 1914, measured 213 feet 8 inches in length and had a beam of 20 feet.

Austria, though not renowned for her naval strength, had certain units which brought up the power of the Teutonic powers considerably. She had nine first-class battleships, the *Erzherzog Karl*, *Erzherzog Ferdinand Max*, *Erzherzog Friedrich*, *Zrinyi*, *Radetzky*, *Erzherzog Franz Ferdinand*, *Teggethoff*, *Prinz Eugen*, and *Viribus Unitis*. These, at the time Austria went to war, ranged in age from nine years to one year, and varied in displacement from 10,000 tons to 20,000 tons. The largest guns carried by any of them measured 12 inches, and the fastest, the *Prinz Eugen*, made 20 knots. Of secondary importance were the battleships *Kaiserin Maria Theresia*, *Kaiser Karl VI*, and *St. Georg*. The register of battleships was supplemented with ten light cruisers of exceptionally light displacement, the highest being only 3,966 tons. Scouting was their chief function. Austria had, also, 18 destroyers, 63 torpedo boats, and 6 submarines.

Such were the respective strengths of the opponents on that day in July, 1914, when the Crown Prince of Austria-Hungary

lost his life. For ten years the officers of the navy created by the German Admiral von Tirpitz had at all dinners come to their feet, waved their wine glasses and had given the famous toast "Der Tag"—to the day on which the English and German naval hosts would sally forth to do battle with each other. "Der Tag" found both forces quite ready, though the British naval authorities stole a march on their German rivals in the matter of mobilization.

It had been the custom for years in the British navy to assemble the greater part of the British ships during the summer at the port of Spithead, where, decorated with bunting, with flags flying, with visitors in holiday spirit, and with officers and men in smart dress, the vessels were reviewed by the king on the royal yacht.

But in the eventful year of 1914, perhaps by accident, perhaps by design, for the truth may never be known, the review had a different aspect. There was no gaiety. The number of ships assembled that time was greater than ever before—216 actual fighting ships passed slowly before the royal yacht—there were no flags, no bunting, no holiday crowds, no smart dress for officers and men. Instead, the fleet was drawn up ready for battle, with decks cleared, guns uncovered, steam up, and magazines replenished. During the tense weeks in which the war clouds gathered over southern Europe this great fighting force remained in the British home waters, and when, at fifteen minutes after midnight on August 4, "Der Tag" had come, this fleet sailed under sealed orders. And throughout the seven seas there were sundry ships flying the Union Jack which immediately received orders by cable and by wireless.

Of the disposition of the naval forces of Germany less was known. Her greatest strength was concentrated in the North Sea, where the island of Helgoland, the Gibraltar of the north, and the Kiel Canal with its exits to the Baltic and North Seas, furnished excellently both as naval bases and impenetrable protection. Throughout the rest of the watery surface of the globe were eleven German warships, to which automatically fell the task of protecting the thousands of ships which, flying the Ger-

man red, white, and black, were carrying freight and passengers from port to port.

The first naval movements in the Great War occurred on the morning of August 5, 1914. The British ship *Drake* cut two cables off the Azores which connected Germany with North and South America, thus leaving these eleven German fighting ships without communication with the German admiralty direct. And the war was not a day old between England and Germany before the German ship *Königin Luise* was caught sowing mines off the eastern English ports by the British destroyer *Lance*.

CHAPTER XXXIII

FIRST BLOOD—BATTLE OF THE BIGHT

THE Germans had taken heed of the value of mines from lessons learned at the cost of Russia in the war with Japan, and set about distributing these engines of destruction throughout the North Sea. The British Admiralty knowing this, sent out a fleet of destroyers to scour home waters in search of German mine layers.

About ten o'clock on the morning of August 5, 1914, Captain Fox, on board the *Amphion*, came up with a fishing boat which reported that it had seen a boat "throwing things overboard" along the east coast. A flotilla, consisting of the *Lance*, *Laurel*, *Lark* and *Linnet*, set out in search of the stranger and soon found her. She was the *Königin Luise*, and the things she was casting overboard were mines. The *Lance* fired a shot across her bow to stop her, but she put on extra speed and made an attempt to escape. A chase followed; the gunners on the British ship now fired to hit. The first of these shots carried away the bridge of the German ship, a second shot missed, and a third and fourth hit her hull. Six minutes after the firing of the first shot her stern was shot away, and she went to the bottom, bow up. Fifty of her 130 men were picked up and brought to the English shore.

The first naval blood of the Great War had been drawn by Britain on August 5, 1914. The *Königin Luise's* efforts had not been in vain. She had posthumous revenge on the morning of August 6, when the *Amphion*, flagship of the third flotilla of destroyers hit one of the mines which the German ship had sowed. It was seen immediately by her officers that she must sink; three minutes after her crew had left her there came a second explosion, which, throwing débris aloft, brought about the death of many of the British sailors in the small boats, as well as that of a German prisoner from the *Königin Luise*.

All the world, with possibly the exception of the men in the German admiralty, now looked for a great decisive battle "between the giants" in the North Sea. The British spoke of it as a coming second Trafalgar, but it was not to take place. For reasons of their own the Germans kept their larger and heavier ships within the protection of Helgoland and the Kiel Canal, but their ships of smaller type immediately became active and left German shores to do what damage they might to the British navy. It was hoped, perhaps, that the naval forces of the two powers could be equalized and a battle fought on even terms after the Germans had cut down British advantage by a policy of attrition.

A flotilla of German submarines on August 9 attacked a cruiser belonging to the main British fleet, but was unable to inflict any damage. The lord mayor of the city of Birmingham received the following telegram the next morning: "Birmingham will be proud to learn that the first German submarine destroyed in the war was sunk by H. M. S. *Birmingham*." Two shots from the British ship had struck the German *U-15*, and she sank immediately.

The German admiralty, even before England had declared war, suspected that the greatest use for the German navy in the months to come would be to fight the British navy, but they ventured to show their naval strength against Russia beforehand. Early in August they sent the *Augsburg* into the Baltic Sea to bombard the Russian port of Libau, but after doing a good bit of damage the German ship retired. It is probable that this raid

was nothing more than a feint to remind Russia that she continually faced the danger of invasion from German troops landed on the Baltic shores under the cover of German ships, and that she must consequently keep a large force on her northern shores instead of sending it west to meet the German army on the border.

Among the German ships which were separated from the main fleet in the North Sea, and which were left without direct communication with the German admiralty after the cutting of the cables off the Azores by the *Drake*, were the cruisers *Goeben* and *Breslau*. When England declared war these two German ships were off the coast of Algeria. Both were very fast vessels, having a speed of 28 knots, and they were designed to go 6,000 knots without needing replenishment of their coal bunkers.

On the morning of August 5, after having bombarded some of the coast cities of Algeria they found themselves cut off on the east by a French fleet and on the west by an English fleet, but by a very clever bit of stratagem they escaped. The band of the *Goeben* was placed on a raft and ordered on a given moment to play the German national airs after an appreciable period. Meanwhile, under the cover of the night's darkness the two German ships steamed away. After they had a good start the band on the raft began to play. The British patrols heard the airs and immediately all British ships were searching for the source of the music. To find a small raft in mid-sea was an impossible task, and while the enemy was engaged in it the two Germans headed for Messina, then a neutral port, which they reached successfully. The Italian authorities permitted them to remain there only twenty-four hours.

Before leaving they took a dramatic farewell, which received publicity in the press of the whole world, and which was designed to lead the British fleet commanders to believe that the Germans were coming out to do battle. Instead, they headed for Constantinople. They escaped all the ships of the British Mediterranean fleet with the exception of the cruiser *Gloucester*. With this ship they exchanged shots and were in turn slightly damaged, but they reached the Porte in seaworthy condition, and

were immediately sold to the Turkish Government, which was then still neutral. The crews were sent to Germany and were warmly welcomed at Berlin. The officers responsible for their escape were disciplined by the British authorities.

Both Germany and England, the former by means of the eleven ships at large, and the latter by means of her preponderance in the number of ships, now made great efforts to capture trading ships of the enemy. When England declared war there was issued a royal proclamation which stated that up to midnight of August 14 England would permit German merchantmen in British harbors to sail for home ports, provided Germany gave British merchantmen the same privilege, but it was specified that ships of over 5,000 tons would not receive the privilege because they could be converted into fighting ships afterward. But on the high seas enemy ships come upon were captured.

The German admiralty on August 1 had issued orders to German merchantmen to keep within neutral ports, and by this means such important ships as the *Friedrich der Grosse* and *Der Grosser Kurfürst* eluded capture. In the harbor of New York was the *Kronprinzessin Cecilie*, a fast steamer of 23.5 knots. She left New York on July 28 carrying a cargo of \$10,000,000 in gold, and was on the high seas when England declared war. Naturally she was regarded by the British as a great prize, and the whole world awaited from day to day the news of her capture, but her captain, showing great resourcefulness, after nearly reaching the British Isles, turned her prow westward, darkened all exterior lights, put canvas over the port holes and succeeded in reaching Bar Harbor, Me., on the morning of August 5.

Similarly the *Lusitania* and the French liner *Lorraine*, leaving New York on August 5, were able to elude the German cruiser *Dresden*, which was performing the difficult task of trying to intercept merchantmen belonging to the Allies as they sailed from America, while she was keeping watch against warships flying the enemies' flags. Still more important was the sailing from New York of the German liner *Kaiser Wilhelm der Grosse*. This ship had a speed of 22.5 knots and a displacement of 14,349 tons. During the first week of the war she cleared the port of

New York with what was believed to be a trade cargo, but she so soon afterward began harassing British trading ships that it was believed that she left port equipped as a vessel of war or fitted out as one in some other neutral port. The continued story of the German raids on allied trading ships must form a separate part of this narrative. It was only a month after the outbreak of hostilities that the fleets of the allied powers had swept clean the seven seas of all ships flying German and Austrian flags which were engaged in trade and not in warlike pursuits.

The first naval battle of the Great War was fought on August 28, 1914. "A certain liveliness in the North Sea" was reported through the press by the British admiralty on the 19th of August. Many of the smaller vessels of the fleet of Admiral von Ingenohl, the German commander, such as destroyers, light cruisers, and scouting cruisers, were sighted. Shots between these and English vessels of the same types were exchanged at long range, but a pitched battle did not come for still a week. Meanwhile the British navy had been doing its best to destroy the mine fields established by the Germans. Trawlers were sent out in pairs, dragging between them large cables which cut the mines from the sea-bottom moorings. On being loosened they came to the surface and were destroyed by shots from the trawlers' decks.

On the 28th of August came the battle off the Bight of Helgoland. The island of Helgoland had been a British possession from 1807 till 1890, when it was transferred to Germany by treaty. It was seen immediately by the Germans that it formed an excellent natural naval base, lying as it does, thirty-five miles northwest of Cuxhaven and forty-three miles north of Wilhelmshaven. They at once began to augment the natural protection it afforded with their own devices. Two Zeppelin sheds were erected, concrete forts were built and 12-inch guns were installed. The scene of the battle which took place here was the Bight of Helgoland, which formed a channel eighteen miles wide some seven miles north of the island and near which lay the line of travel for ships leaving the ports of the Elbe.

British submarines which had been doing reconnaissance work

on the German coast since August 24 reported to the British commander, Admiral Jellicoe, that a large force of German light cruisers and smaller craft were lying under the protection of the Helgoland guns, and he immediately arranged plans for leading this force away from that protection in order to give it battle. Briefly the plans made provided that three submarines were to proceed on the surface of the water to within sight of the German ships and when chased by the latter were to head westward. The light cruisers *Arethusa* and *Fearless* were detailed to run in behind any light German craft which were to follow the British submarines, endeavoring to cut them off from the German coast, and these two vessels were backed by a squadron of light cruisers held in readiness should the first two need assistance. Squadrons of cruisers and battle cruisers were detailed to stay in the rear, still further to the northwest, to engage any German ships of their own class which might get that far.

It was at midnight on August 26 that Commodore Keyes moved toward Helgoland with eight submarines accompanied by two destroyers. During the next day—August 27—this force did nothing more than keep watch for German submarines and scouting craft, and then took up its allotted position for the main action. The morning of the 28th broke misty and calm. Under half steam three of the British submarines, the *E-6*, *E-7*, and *E-8* steamed toward the island fortress, showing their hulls above water and followed by the two detailed destroyers.

The mist thickened. Still more slowly and cautiously went the British submersibles, and while they went above water, five of their sister craft traveled under the surface. Here was the bait for the German ships under Helgoland's guns. Would they bite?

The Germans soon gave the answer. First there crept out a German destroyer which took a good look at the situation and then gave wireless signals to some twenty more of her type, which soon came out to join her. The twenty-one little and speedy German boats bravely came out and chased the two British destroyers and three submarines, while a German seaplane slowly circled upward to see if the surrounding regions harbored enemies. Presumably the airman found what he

sought for he soon flew back to report to Helgoland. The peaceful aspect of the waters to the east of the island immediately changed, as a squadron of light cruisers weighed anchor and put out after the retiring Britishers.

Before a description of the fighting can be given it is necessary to understand the plan of the fight as a whole. Assuming that the page on which these words are printed represents a map of the North Sea and that the points of the compass are as they would be on an ordinary chart, we have the island of Helgoland, half an inch long and a quarter of an inch wide, situated in the lower right-hand corner of this page, with about half an inch separating its eastern side from the right edge of the page and the same distance separating it from the bottom. The lower edge of the page may represent the adjoining coasts of Germany and Holland, and the right-hand edge may represent the coast of the German province of Schleswig and the coast of Denmark.

At seven o'clock on the morning of August 28 the positions of the fighting forces were as follows: The decoy British submarines were making a track from Helgoland to the northwest, pursued by a flotilla of German submarines, destroyers, and torpedo boats, and a fleet of light cruisers. On the west—the left edge of the page, halfway up—there were the British cruisers *Arethusa* and *Fearless* accompanied by flotillas, and steaming eastward at a rate that brought them to the rear of the German squadron of light cruisers, thus cutting off the latter from the fortress. In the southwest—the lower left-hand corner of the page—there was stationed a squadron of British cruisers, ready to close in when needed; in the northwest—the upper left-hand corner of the page—there were stationed a squadron of British light cruisers and another of battle cruisers, and it was toward these last two units that the decoys were leading the German fleets.

The *Arethusa* and *Fearless* felt the first shock of battle, on the side of the British. The German cruiser *Ariadne* closed with the former, while the latter soon found itself very busy with the German cruiser *Strassburg*. For thirty-five minutes—before the *Fearless* drew the fire of the *Strassburg*—the two German vessels poured a telling fire into the *Arethusa*, and the latter was soon in

bad condition, but she managed to hold out till succored by the *Fearless*, and then planted a shell against the *Ariadne* which carried away her forebridge and killed her captain. The scouting which had been done by the smaller craft of the German fleets showed their commanders that there were other British ships in the neighborhood besides the two they had first engaged, and it was thought wiser to withdraw in face of possible reenforcement of the British, consequently the *Strassburg* and *Ariadne* turned eastward to seek the protection of the fortress. The *Arethusa*, a boat that had been in commission but a week when the battle was fought, was in a bad way; all but one of her guns were out of action, her water tank had been punctured and fire was raging on her main deck amidships. The *Fearless* passed her a cable at nine o'clock and towed her westward, away from the scene of action, while her crew made what repairs they could.

The flotillas of both sides had meanwhile been busy. At the head of the squadron of German destroyers that came out of the waters behind Helgoland was the *V-187*. Without slacking speed she steamed straight for the British destroyers, her small guns spitting rapidly, but she was outnumbered by British destroyers, which poured such an amount of steel into her thin sides that she went under, her guns firing till their muzzles touched the water and her crew cheering as they went to their deaths. A few managed to keep afloat on wreckage, and during a lull in the fighting, which lasted from nine o'clock till ten, boats were lowered from the British destroyers *Goshawk* and *Defender* to pick up these stranded German sailors.

The commanders of the German fleet, perceiving these small boats from afar, thought that the British were resorting to the old principle of boarding, and the huge German cruiser *Mainz* came out to fire upon them. Two of the British small boats had to be abandoned as their mother ships made off before the oncoming German. They were in a perilous position, right beneath the guns of the fortress. But now a daring and unique rescue took place. The commander of the British submarine *E-4* had been watching the fighting through the periscope of his craft, and seeing the helpless position of the two small boats, he sub-

merged, made toward them, and then, to the great surprise of the men in them, came up right between them and took their occupants aboard his boat.

Repairs had been made on the *Arethusa* which enabled her to go into action again by ten o'clock. Accompanied again by two flotillas and the *Fearless*, she turned westward at that hour in answer to calls for assistance from the *Lurcher* and *Firedrake*, which were accompanying the submarines and which reported that they were being chased by fast German cruisers. Suddenly the *Strassburg* again came speeding from out the mist and bore down on the British cruisers. Her larger guns were too heavy and had too long a range for those of the British craft, and the latter immediately sent out calls which brought into action for the first time certain ships belonging to the squadron of British light cruisers, which had been stationed to the northwest—the upper left-hand corner of the page.

The vessels which answered the calls were the dreadnoughts *Falmouth* and *Nottingham*, but while they were speeding on their mission the *Strassburg* still had time to inflict more damage on the *Arethusa*. The cruisers *Köln* and *Mainz* joined the *Strassburg*, and the British vessels were having a bad time of it when their commander ordered the *Fearless* to concentrate all fire on the *Strassburg*. This, and a concentrated fire from the destroyers, proved too strong for her and she turned eastward, disappearing in the mist off Helgoland. The *Mainz* then received the attention of all available British guns, and soon fire broke out within her hold. Next her foremast, slowly tottering and then inclining more and more, crashed down upon her deck, a distorted mass. Following that came down one of her funnels. The fire which was raging aboard her was hampering her machinery, and her speed slackened; the moment to strike with a torpedo had come, and one of these "steel fishes" was sent against her hull below water. In the explosion which followed one of her boilers came out through her deck, ascended some fifty feet and dropped down near her bow; her engines stopped, and she began to settle slowly, her bow going down first.

It was now noon. From behind the veil of the surrounding

mist came the *Falmouth* and *Nottingham*, which with the guns in their turrets completely finished the hapless *Mainz*, and their sailors openly admired the bravery of her crew, which, while she sank, maintained perfect order and sang the German national air.

There was yet the *Köln* with which the *Arethusa* had to do battle. But by now the heavy British battle cruisers *Lion* and *Queen Mary* had also come down from the northwest to take part in the fighting, and letting the *Arethusa* escape from the long range of the *Köln's* 13.5-inch guns, they went for the German, which, overpowered, fled toward Helgoland. While the chase was on the *Ariadne* again made her appearance and came to the aid of the *Köln*, but the *Ariadne* carried no gun as effective in range and destructive power as the 13.5-inch guns of the *Lion*, and she, too, had to seek safety in flight. The British ships then finished the *Köln*; so badly was she hit that when the British small boats sought the spot where she quickly sank they found not a man of her crew afloat. Every man of the 370 of her crew had gone to his death.

The afternoon came, and with its advent the mist, which had kept the guns of Helgoland's forts out of action, had cleared off the calm waters of the North Sea. By the time the sun had set only floating wreckage gave evidence that here brave men had fought and died. By evening the respective forces were in their home ports, being treated for their hurts. The Germans had lost the *Mainz*, *Köln*, and *Ariadne*, and the *Strassburg* had limped home. The loss in destroyers and other small craft in addition to that of the *V-187* was not known. The loss on the British side had not entailed that of a large ship, but the *Arethusa* when she returned to her home port was far from being in good condition, and some of the smaller boats were in the same circumstances.

Admiral von Ingenohl was committed more strongly than ever, as a result of this engagement, to the belief that the best policy for his command would be to keep his squadrons within the protection afforded by Helgoland and that the most damage could be done to the enemy by picking off her larger ships one by one. In other words, he again turned to the policy of attrition. He immediately put it into force.

On the 3d of September the British gunboat *Speedy* struck a mine in the North Sea and went down. It was only two days later that the light cruiser *Pathfinder* was made the true target of a torpedo fired by a German submarine off the British eastern coast, and she, too went to the bottom. But the British immediately retaliated, for the submarine *E-9* sighted the German light cruiser *Hela* weathering a bad storm on September 13 between Helgoland and the Frisian coast. A torpedo was launched and found its mark, and the *Hela* joined the *Köln* and *Mainz*. Up to this point the results of attrition were even, but the Germans scored heavily during the following week.

On September 22 the three slow British cruisers *Cressy*, *Hogue*, and *Aboukir* were patrolling the waters off the Dutch coast, unaccompanied by small craft of any kind, when suddenly, at half past six in the morning, the *Aboukir* crumpled and sank, the victim of another submarine attack. But the commander of the *Hogue* thought she had been sunk by hitting a mine, and innocently approached the spot of the disaster to rescue such of the crew of the *Aboukir* as were afloat. The work of mercy was never completed, for the *Hogue* itself was hit by two torpedoes in the next few moments, and she joined her sister ship. The commander of the *Cressy*, failing to take a lesson from what he had witnessed, now approached, and his ship was also hit by two torpedoes, making the third victim of the German policy of attrition within an hour, and Captain Lieutenant von Weddigen, commander of the *U-9*, which had done this work, immediately became a German hero.

CHAPTER XXXIV

BATTLES ON THREE SEAS

SO stood the score in the naval warfare in the North Sea at the end of the second month of the Great War. But while these events were taking place in the waters of Europe, others of equal import had been taking place in the waters of Asia. On August 23, 1914, Japan declared war on Germany and immediately set about scouring the East for German craft of all kinds.

Japan brought to the naval strength of the Allied powers no mean unit. Hers was the only navy in the world which had seen the ultra-modern battleships in action; the Russian navy which had had the same experience was no more. Eight of her first-class battleships were, at the time of her entrance into the Great War, veterans of the war with Russia. The *Fuji*, *Asahi*, *Kikasa*, and *Shikishima* had gone into the former war as Japanese ships, and the remaining four had gone into it as Russian ships, but had been captured by the Japanese. These were the *Hizen*, *Sagami*, *Suwo*, and *Iwami*. Their value was not great, for the *Fuji* had been launched as far back as 1896. Nevertheless she carried 12-inch guns and displaced 12,300 tons. But her speed was only 17 knots at the most. She had been built in England as had the *Asahi* and *Shikishima*, which were launched in 1900 and 1901. They also carried 12-inch guns and had a speed of 18.5 knots. Their tonnage was 15,000. Admiral Togo's former flagship, the *Mikasa*, was also of the predreadnought type, having been built in 1900, and carrying a main battery of 12-inch guns. Her speed was 18.5 knots.

Of the former Russian ships the rechristened *Iwami* was of French build, protected with Krupp steel armor to the thickness of 7.5 inches. Her displacement was 13,600 tons, and her speed 18 knots. Like the other ships of this class in the Japanese navy, she carried a main battery of 12-inch guns. The *Hizen* was an American product, having been built by Cramps in 1902. Her displacement was 12,700 tons, made a speed of 18.5 knots, was

also protected with Krupp steel and carried four 10-inch guns. She was a real veteran, for she had undergone repairs necessitated by having been torpedoed off Port Arthur and had been refloated after being sunk in later action there. The *Sagami* and the *Suwo* had been built in 1901 and 1902. They displaced 13,500 tons, had a speed of 18.5 knots, and carried as their heaviest armament 10-inch guns.

In addition to these eight ships Japan had also nine protected cruisers, all of the same type and all veterans of the war with Russia. They were of such strength and endurance that the Japanese admiralty rated them capable of taking places in the first line of battle. These were the *Nisshin* and *Kasuga*, purchased from Italy and built in 1904, displacing 7,700 tons, and making a speed of 22 knots; the *Aso*, French built and captured from the Russians, and of the same design and measurements as the other two; and the protected cruisers *Yakumo*, *Asama*, *Idzumo*, *Tokiwa*, *Aguma*, and *Iwate*, built before the war with Russia, slightly heavier than their sister ships but not as fast. None of this type has been added to the Japanese navy since 1907. Japan has, instead, given attention to scouting cruisers, with the result that she possessed three excellent vessels of this class, the *Yahagi*, *Chikuma*, and *Hirato*, with the good speed of 26 knots and displacing 5,000 tons. They were built in 1912. And not so efficient were the other ships of similar design, the *Soya*, built in America, *Tone* and *Tsugaru*.

The veteran Japanese navy was supplemented with 52 destroyers and 15 submarines, all built since the war with Russia, and a number of heavier vessels. Among the latter were the first-class battleships *Kashima* and *Katori*, completed in 1906, and displacing 16,400 tons. Their heavy guns measured 12 inches, and they made a speed of 19.5 knots. There were also the vessels *Ikoma* and *Tsukuba*, individual in type, with corresponding kinds in no other navy, and which might be called a cross between an armored cruiser and battle cruiser. Though displacing no more than 13,766 tons, they carried four 12-inch guns, and made the comparatively low speed of 20.5 knots. In 1909 and 1910 the Japanese added two more ships of this kind

to their navy, the *Ibuki* and *Kurama*, slightly heavier and faster and with the same armament.

The dreadnought *Satsuma* also came in 1910—a vessel displacing 19,400 tons, but making a speed of only 18.2 knots, and with an extraordinarily heavy main battery consisting of four 12-inch guns and twelve 10-inch guns. The *Aki*, launched in 1911, was 400 tons heavier than the *Satsuma*, and was more than 2 knots faster, and her main battery was equally strong. The dreadnoughts *Settsu* and *Kawachi*, completed in 1913 and 1912 respectively, displaced 21,420 tons, but were able to make not more than 20 knots. At this time the Japanese admiralty, perhaps on account of lessons learned in the war with Russia, was building dreadnoughts with less speed than those in the other navies, but with much heavier main batteries. These two vessels carried a unique main battery of twelve 12-inch guns, along with others of smaller measurement. What the dreadnoughts lacked in speed was made up in that of four battle cruisers launched after 1912. These were the *Kirishima*, *Kongo*, *Hi-Yei*, and *Haruna*, with the good speed of 28 knots. Their displacement was 27,500 tons, and they carried in their primary batteries eight 14-inch guns and sixteen 6-inch guns.

At the time Japan entered the war she had in building four superdreadnoughts with the tremendous displacement of 30,600 tons. These vessels, the *Mitsubishi*, *Yukosaka*, *Kure*, and *Kawasaki*, had been designed to carry a main battery of the strength of the U. S. S. *Pennsylvania*, and to have a speed of 22.5 knots.

The first move of the Japanese navy in the Great War was to cooperate with the army in besieging the German town of Kiaochow on the Shantung Peninsula in China, but the operation was soon more military than naval. Japanese warships captured Bonham Island in the group known as the Marshall Islands, and, having cleared eastern waters of German warships, scoured the Pacific in such a manner as to chase those which escaped into the regions patrolled by the British navy.

The German vessels which made their escape were among the eleven which were separated from the rest of Germany's navy in the North Sea at the outbreak of hostilities. They were, with

the exception of the *Dresden*, the *Leipzig*, *Nürnberg*, *Scharnhorst*, and *Gneisenau*. It was weeks before they were first reported—on September 22 at the harbor of Papeete, where they destroyed the French gunboat *Zelie*, and after putting again to sea their location was once more a mystery.

On the evening of November 1 a British squadron consisting of the vessels *Good Hope*, *Otranto*, *Glasgow*, and *Monmouth* had rounded the Horn, and on that day the two forces sighted each other. The British ships lined up abreast and proceeded in a northeasterly direction. The Germans took up the same alignment eight miles to the westward of the British ships and proceeded southward at full speed. Both forces opened fire at a distance of 12,000 yards shortly after six o'clock off Coronel near the coast of Chile. The *Scharnhorst* and *Gneisenau* picked the *Good Hope* as their first target, but finding that they could do no damage at that range and that they were safe from the fire of the British ship, they came to within 6,000 yards of her. Her fire in reply was augmented by that of the *Monmouth*. Excellent aim on the part of the Germans soon had the *Good Hope* out of action, for her conning tower was damaged almost immediately, and fire broke out aboard her.

The *Monmouth* then got between the German ships and the wounded *Good Hope*, and coming in for her share of the destructive German fire, also suffered, being put virtually out of action, and at the same time there occurred an explosion on board the former and she sank immediately, carrying Admiral Cradock to his death.

There remained of the British force only the *Otranto*—a converted liner and not really a battleship of the line—the *Glasgow* and the partially disabled *Monmouth* to continue the fight with an efficient German force. The British commander ordered the former two to get away by making speed, but the officer in charge of the *Glasgow*, paying no heed to the order, kept in the fight.

Dusk was then coming on and the *Glasgow* sought to take advantage of it by getting between the German ships and the limping *Monmouth*, concealing the latter from them with her smoke. But the Germans had now come to within 4,500 yards.

To escape possible attack from torpedoes the German ships spread out their line, but perceiving that such a danger was not present, they again closed in to finish the crippled British ships. All of the German ships now went for the *Glasgow*, and she had to desert the *Monmouth*, which first sailed northward, in bad condition, and later made an attempt to rejoin the *Glasgow*. But the latter also had enough and turned stern to the Germans.

The inevitable "if" played its part in the battle. When the British fleet first went after the Germans it had as one of its units the battleship *Canopus*. But her speed was not up to that of the other ships, and she fell far to their stern. By the time the action was on she was too distant to take part in it; vainly the British ships sent wireless calls to her during the fight, but the operators on Admiral von Spee's vessels "jammed" their sending instruments, making communication with the *Canopus* impossible. The setting of the sun also played its part; if daylight had continued some hours more the British squadron might have held out till the *Canopus* brought up, for the almost horizontal rays of the sun were in the eyes of the German gunners. But as it dropped below the watery horizon it left the British ships silhouetted against the coast—excellent targets for German shells. The *Canopus* did not get into the fight, and the greatest concern of the *Glasgow* as she steamed off was to warn the British battleship to keep off, for of less speed than the German ships, and outnumbered by them, her appearance meant her destruction. The *Glasgow*, later joined by the *Canopus*, arrived in battered condition at the Falkland Islands. The *Monmouth*, after the main action was over, was found and finished by the German squadron and went down. Germany had evened the score in the second battle between fleets.

Most remarkable had been the career of the German third-class cruiser *Nürnberg*, which had joined the other German ships that went to make up the German squadron which fought in this battle off Coronel. This vessel, on the day after Germany and England went to war, was lying near Yap, an island in the Pacific, that had been, until captured by the Japanese, the wireless station of most importance to the Germans in the Pacific

Ocean. She immediately, after being apprised that she was part of a navy engaged in a war, set sail and was not reported again until the 7th of September, when she appeared at Fanning Island, a cable station maintained by Britain, and from which cables run to Vancouver to the east and Australia to the west. Here she performed a clever bit of work by entering the harbor flying the tricolor of France and appearing as though she was making a friendly visit. Officials on the island, happy to think they would have such a visitor, saw two cutters leave the warship to accept a greeting on behalf of the supposedly French officers.

Great was the surprise of those watching events from the shore when they saw the French flag lowered from the masthead of the visitor and in its place the German naval ensign run up. The cutters were just about reaching knee-deep water at the shore when this surprise came, and it was augmented when, with the protection of the guns of the vessel, the men in these cutters showed themselves to be a hostile landing party. To throw off the rest of her disguise the German ship displayed her name at her bow—*Nürnberg*—which had heretofore been hidden by a piece of canvas.

Her presence was not reported to the rest of the world for the good reason that she cut all cables leading from the island. All the British men there were put under guard, and after damaging all cable instruments she could find, the *Nürnberg*, accompanied with a collier that had come with her, again took to the high seas.

She next turned up at the island of St. Felix, 300 miles west of the Chilean coast, but did not come to the harbor. During the night of October 14 the inhabitants of that island saw the flash and heard the roar of an explosion miles out to sea, and for a number of days later they picked up on their beach the wreckage of what must have been a collier. It is probable that the destroyed ship had been on its way to join Admiral Cradock's squadron, for it was only two weeks later that the action off Coronel took place. As has been related in preceding paragraphs, the *Nürnberg* took part in that fight. The end of her career came in the battle off the Falkland Islands, which will be dealt with later.

CHAPTER XXXV

THE GERMAN SEA RAIDERS

WHILE British men-o'-war were capturing German merchantmen and taking them to British ports, the German raiders which were abroad were earning terrifying reputations for themselves because the enemy merchantmen with which they came upon had to be destroyed on the high seas, for there were no ports to which they could be taken. Prominent among these was the *Königsberg*, a third-class cruiser. When the war came she was in Asiatic waters and immediately made the east coast of Africa her "beat." While patrolling it she came upon two British merchant ships, and after taking from her stores such supplies as were needed, she sent them to the bottom. On September 20, 1914, she made a dash into the harbor of Zanzibar and found there the British cruiser *Pegasus*, which on account of her age was undergoing a complete overhauling. She was easy prey for the German ship, for besides the fact that she was stationary her guns were of shorter range than those of her adversary. Shell after shell tore into her till she was battered beyond all resemblance to a fighting craft. But her flag flew till the end, for though it was shot down from the masthead, two marines held it aloft, one of them losing his life. And when the *Königsberg*, her task of destruction complete, sailed off, the lone marine still held up the Union Jack. The British ships in those waters made a systematic hunt for her and located her at last, on the 30th of October. She was hiding in her favorite rendezvous, some miles up the Rufigi River in German East Africa. The ship which found her was the *Chatham*, a second-class cruiser, with a draft much heavier than that of the *Königsberg*, and the difference gave the latter a good advantage, for she ran up the river and her enemy could not follow. Nor could the English ship use its guns with much effect, for the gunners could not make out the hull of the German ship through the tropical vegetation along the river banks. All that the British ship could do

was to fire shells in her general direction and then guess what effect they had. But to prevent her escape, colliers were sunk at the mouth of the river. She had come to as inglorious an end as her victim, the *Pegasus*.

Another raider, the *Kronprinz Wilhelm*, which had sailed from New York on the evening that England declared war with her bunkers loaded with coal and other supplies for warships, has already been related. The mystery concerning this sailing was cleared up when she was caught coaling the *Karlsruhe* in the Atlantic. Both ships made off in safety that time, and soon after a British cruiser reported that she had been heard in wireless communication with the *Dresden*. Thereafter the fate of this ship remained a mystery till she put in at Hampton Roads on April 11, 1915.

Most spectacular was the career of the *Emden*, a third-class cruiser, which sailed from Japanese waters at the same time as the *Königsberg*. Through the ability of her commander, Captain Karl von Müller, she earned the soubriquet "Terror of the East," for by using a clever system of supply ships she was able to raid eastern waters for ten weeks without making a port or otherwise running the risk of leaving a clue by which British ships might find her. Her favorite occupation was that of stopping enemy merchantmen which she sank. But her captain always allowed one—the last one—of her prizes to remain afloat, and in this he sent to the nearest port the officers, passengers, and crews of those that were destroyed. At times he used prizes as colliers, putting them under command of his petty officers.

By way of diversion, Captain von Müller steamed into the harbor of Madras in the Bay of Bengal and opened with his guns on the suburbs of the town, setting on fire two huge oil tanks there. The fort there returned the fire, but the *Emden* after half an hour sailed away unharmed. She had been enabled to come near the British guns on shore by flying the French flag, which she continued to display until her guns began to boom. She then left the waters of Bengal Bay, but not before she had ended the journey of \$30,000,000 worth of exports to India, and

had sent to the bottom of the sea some \$15,000,000 worth of imports. Twenty-one steamers had been her victims, their total value having been about \$3,250,000, and their cargoes were worth at least \$15,000,000. Very expensive the British found her, and they were willing to go to any length to end her career. They curtailed her activities somewhat when the *Yarmouth* captured the converted liner *Markomannia*, which was one of her colliers, and recaptured the Greek freighter *Pontoporos*, which had been doing the same duty. This took place off the coast of Sumatra.

But Von Müller was undaunted, even though his coal problem was becoming serious. He knew that the *Yarmouth* had sailed from Penang near Malacca and that she was not at that base, since she was searching for his own vessel. He therefore conceived the daring exploit of making a visit to Penang while the *Yarmouth* was still away. He came within ten miles of the harbor on the 28th of October, and disguised his ship by erecting a false funnel made of canvas upheld by a wooden frame, much like theatrical scenery. This gave the *Emden* four funnels, such as the *Yarmouth* carried. Coming into the harbor in the twilight of the dawn, she was taken by those on shore to be the British ship, not a hostile gun ready for her.

Lying in the harbor was the Russian cruiser *Jemchug* and three French destroyers and a gunboat. The watch on the Russian ship questioned her, and was told by the wireless operator on the *Emden* that she was the *Yarmouth* returning to anchor. By this ruse the German ship was enabled to come within 600 yards of the Russian ship before the false funnel was discovered. Fire immediately spurted from the Russian guns, but a torpedo from the *Emden* struck the *Jemchug's* engine room and made it impossible for her crew to get ammunition to her guns. Von Müller poured steel into her from a distance of 250 yards with terrible effect. The Russian ship's list put many of her guns out of action, and she was unable to deliver an effective reply. Another torpedo from the *Emden* exploded her magazine. Fifteen minutes after the firing of the first shot the Russian had gone to the bottom.

Von Müller now put the prow of the *Emden* to sea again, for

he feared that both the *Yarmouth* and the French cruiser *Dupleix* had by then been summoned by wireless. Luck was with him. Half an hour after leaving the harbor he sighted a ship flying a red flag, which showed him at once that she was carrying a cargo of powder. He badly needed the ammunition, and he prepared to capture her. But this operation was interrupted by a mirage, which caused the small French destroyer *Mosquet* to appear like a huge battleship. When he discovered the truth, Von Müller closed with the Frenchman, who came to the rescue of the *Glenturret*, the powder ship. Destroyer and cruiser closed for a fight, the former trying to get close enough to make work with torpedoes possible, but the long range of the *Emden's* guns prevented this, and the *Mosquet* was badly damaged by having her engine room hit. Soon he was in a bad way, and Von Müller ordered his guns silenced, thinking the destroyer would now give up the fight. But the Frenchman was valiant and refused to do so; he let go with two torpedoes which did not find their mark, and was immediately subjected to a withering fire, which caused his ship to sink, bow first.

One of the destroyers which had been in the harbor now came out to take issue with the *Emden*, but it was the business of the latter to continue destroying merchant ships and not to run the risk of having her career ended by a warship, so she immediately put off for the Indian Ocean. A storm which then came up permitted her to make a better escape.

It was not until the 9th of November that the world at large heard more of her, and it proved to be the last day of her reign of terror. There was a British wireless and cable station on the Cocos (Keeling) Isles, southwest of Java, and Von Müller had determined to interrupt the communication maintained there connecting India, Australia, and South Africa. Forty men and three officers, with three machine guns, were detailed by him as a landing party to destroy instruments and cut the cables. But such a thing had been partially forestalled by the British authorities, who had set up false cable ends. These were destroyed by the deceived Germans. When the *Emden* had first made her appearance the news had been sent out by the wireless

operator on shore, not knowing what ships would pick up his calls.

This time luck was against Von Müller, for it so happened that a convoy of troop ships from Australia was passing within one hundred miles. They were accompanied by the Australian cruisers *Melbourne* and *Sydney*. The latter was dispatched to go to the Cocos Islands, and by getting up a speed of 26 knots she reached them in less than three hours. Von Müller knew that escape by flight was impossible, for his ship had been weeks at sea; her boilers were crusted, her machinery badly in need of repair, and she had not too much coal. He therefore decided to give battle, and went straight for the *Sydney* at full speed. His object was to meet her on even terms, for her advantage was that her guns had much greater range than those of the *Emden*. If he could get close enough he might be able to use his torpedo tubes. But Captain Glossop of the *Sydney* saw through this maneuver and maintained good distance between the two ships. The first shots came from the *Emden*, and these, like the rest she let go, fell short.

The replies from the Australian ship were fatal. The foremost funnel of the *Emden* crumpled and fell; her fire almost ceased, and then she began to burn; the second funnel and the third fell also; there was nothing left but to beach her, which Von Müller did, just before noon. While she lay there helpless the *Sydney* shot more steel into her, leaving her quite helpless, and then went off to chase a merchant ship which had been sighted during the fighting and which, when caught, proved to be the British ship *Buresk*, now manned by Germans and doing duty as collier to the *Emden*. Returning to the latter, Captain Glossop saw that she still flew the German flag at her masthead. He signaled her, asking whether she would surrender, but receiving no reply after waiting five minutes he let her have a few more salvos. The German flag came down and the white flag went up in its place. The *Jemchug* had been avenged, and the terribly costly career of the *Emden* brought to an end. Von Müller was taken prisoner, and on account of his valor was permitted to keep his sword. But the landing party, which had cut

the false cables, was still at large. The adventures of these three officers and forty men form a separate story, which will be narrated later.

CHAPTER XXXVI

BATTLE OFF THE FALKLANDS

THE defeat of the British squadron back in the first week of November had sorely tried the patience of the British public, and the admiralty felt the necessity of retrieving faith in the navy. Von Spee was still master of the waters near the Horn, and till his ships had again been met the British could not boast of being rulers of the waves. Consequently Admiral Fisher detailed the two battle cruisers *Invincible* and *Inflexible* to go to the Falkland Islands. They left England November 11, 1914, and on the outward journey met with and took along the protected cruisers *Carnarvon*, *Kent*, and *Cornwall*, the second-class cruiser *Bristol*, and the converted liner *Macedonia*. The *Canopus* and the *Glasgow*, now repaired, all joined the squadron, which was commanded by Admiral Sturdee. The vessels coaled at Stanley, Falkland Islands, and while so engaged on December 8 were warned by a civilian volunteer watcher on a nearby hill that two strange vessels had made their appearance in the distance. British naval officers identified them, and other vessels which were coming into view, as the ships of Von Spee's squadron, the one which had been victorious off Coronel.

During the interval that had elapsed since that engagement these German ships had not been idle. Von Spee knew that the *Glasgow* had gone to the Falklands and that there were important wireless and cable stations there, but he put off going after those prizes and picked up others. The *Nürnberg* had cut communication between Banfield and Fanning Islands. Two British trading ships had fallen victims to the *Dresden*, and four more had met the same end at the hands of the *Leipzig*. For coal and other supplies Von Spee had been relying on the Chilean ports,

but now came trouble between him and the port authorities, for England was accusing the South American nation of acting without regard to neutrality. It was for this reason that Von Spee turned southward to take the Falkland Islands. The world at large, and of course Von Spee, had no knowledge of the ships which had set out from Plymouth for the Falklands on the eleventh of the month, so he approached in full expectation of making not only a raid but for occupation. He knew that he would have to exchange shots with the *Glasgow* and perhaps some small ships, and he believed the islands weakly defended by forts, but there was nothing in that to defer his attack. The result—the lookout near Stanley had reported the oncoming warships *Gneisenau* and *Scharnhorst*, followed by the rest of the German squadron. German guns fired on the wireless station, and great was the surprise of the unfortunate Von Spee and his officers when there was heard in reply the booming of guns which they knew immediately must be mounted on warships larger than their own. Their scouting had been defective, and the presence of the *Inflexible* and *Invincible* had till then not been discovered. They then reasoned that these were the guns of the *Canopus*—a critical and fatal error.

The *Canopus* then came out from behind the hills and fired on the German ships in an endeavor to protect the wireless station. Beyond the range of her guns hovered the lighter German cruisers *Dresden*, *Leipzig*, *Nürnberg*, and the armed liner *Eitel Friedrich*, which had joined the squadron since the fight off Coronel, to await the outcoming of the *Glasgow*. Both the *Gneisenau* and *Scharnhorst* concentrated their fire on the *Canopus*, and when the *Glasgow*, accompanied by the *Carnarvon*, *Cornwall*, and *Kent*, made her appearance it did not change the battle formation of the Germans, for the *Canopus* was still the only large vessel they were aware of. Now the *Leipzig* came nearer in order to take up the fight with the lighter British ships. By nine in the morning the German ships were drawn out in single file, running parallel with the shore in a northeasterly direction. At the head of the line was the *Gneisenau*, followed by the *Dresden*, *Scharnhorst*, *Nürnberg*, *Leipzig*, and *Eitel Friedrich*,

in that order. They thought that this would entice what they believed to be the whole of the British force present into coming out for a running fight, and in which the old *Canopus* would be left behind to be finished after the lighter vessels were done for. But all this time the *Invincible* and *Inflexible* were silent with their guns, though there was bustle enough aboard them while their coaling was being hurried.

By ten o'clock these two larger ships were ready with steam up and decks cleared, and they came out from behind the hills. Von Spee saw that discretion was the better part of valor and gave orders for his ships to make off at full speed. For a time the two squadrons kept parallel to each other at a distance of twelve miles, with the British squadron—the *Invincible* and *Inflexible* leading—north of the German ships. The *Baden* and *Santa Isabel*, two transports that had been part of the German squadron, were unable to keep up with the others and headed south, pursued by the *Bristol* and *Macedonia*. The two British battle cruisers were faster than any other ships in either squadron, and while pulling up on the German ships were in danger of pulling away from their own ships. To avoid the latter, Admiral Sturdee kept down their speed and was content with taking a little longer to get within gun range of Von Spee's ships. By two o'clock the distance between them was about 16,000 yards; the *Invincible* and *Inflexible* had now left the rest of the British squadron far behind and took issue with the *Scharnhorst* and *Gneisenau* respectively. The remaining British ships, with the exception of the *Carnarvon*, gave attention to the three lighter German cruisers and the *Eitel Friedrich*, which had broken from the first formation and were now pointing southeast.

Von Spee ordered the *Scharnhorst* and *Gneisenau* to turn broadside to the enemy. Shells were falling upon the German ships with fair accuracy, but their return fire could do little damage to the British ships, because the range was a little too great for the German 8.2-inch guns. Those of the *Inflexible* and *Invincible* were of the 12-inch type.

All four ships were belching forth heavy black smoke that hung low over the water after it left the funnels. A moderate breeze

carried it northward, and Von Spee moved his ships this way and that till his smoke blew straight against the guns of the British ships, making it almost impossible for the British gunners to take aim and note effect. But the superior speed of the two British battle cruisers stood them in good stead, and their commanders brought them up south of the enemy—on their other side. It was now the German gunners who found the smoke in their faces, and the advantage was with the British.

By three o'clock in the afternoon fire had broken out on the *Scharnhorst* and Von Spee replied to Sturdee's inquiry that he would not quit fighting, though some of his guns were out of action and those which still replied to the Britisher did now only at intervals. There was evidently something wrong with the machinery that brought shells and ammunition to her guns from out of her hold, the fire probably interfering with it. A 12-inch shell cut right through her third funnel and carried it completely off the ship. She turned so that she could bring her starboard guns into action, and they did so feebly. The fire on board her grew worse and worse, and it could be seen blood-red through holes made by the shells from the *Invincible* whenever her hull showed through the dense clouds of escaping steam that enveloped her. Just at four o'clock she began to list to port, thus having her starboard guns put out of action, for they pointed toward the sky, and the shells which came from them described parabolas, dropping into the water at safe distance from the English ship. More and more she listed, till her port beam ends were in the cold waters of the South Atlantic, and while in that position she sank some fifteen minutes later.

Meanwhile the duel between the *Gneisenau* and *Inflexible* had been going on. The German ship used the sinking *Scharnhorst* as a screen and tried to take on both British ships at the same time, but by five o'clock her forward funnel lay against the second funnel and her fire was weakened. Still she was able to plant some effective shells against the *Invincible* as a final reply. By half-past five she was listing heavily to starboard and her engines had stopped. The British ship, thinking she was surely done for, ceased firing at her and watched her for ten minutes,

while a single gun on board of her fired at intervals. The three ships *Carnarvon*, *Inflexible*, and *Invincible* now closed in on her and punished her till the flag at her stern was hauled down. But the ensign at her peak continued to fly. Just at six o'clock, with this color still in position, she suddenly heeled to starboard, while the men of her crew made hastily up her slanting decks and then climbed over on to the exposed part of her upturned port side. Many of these unfortunate men had time to jump into the sea, but others were caught when she suddenly disappeared beneath the surface.

There remained the task of picking up her survivors, but they were not numerous, for the shock of the cold water killed a large number. Having picked up those whom they could, the three British ships signaled the news of their victories to the distant cruisers which were fighting it out with the *Dresden*, *Leipzig*, *Nürnberg*, and *Eitel Friedrich*.

These lighter German cruisers had left the line of battle and had turned southward at just about the time that the action between the *Scharnhorst* and *Gneisenau* and *Inflexible* and *Invincible* began. They started off with the *Dresden* at the foremost point of a triangle and with the other two at the two remaining points. The *Glasgow*, *Cornwall*, and *Kent* went after them, while the *Carnarvon*, because her speed was not high enough to accompany them, remained with the battle cruisers. The *Glasgow* drew up with the German ships first, and at three o'clock began to fire on the *Leipzig* at a distance of 12,000 yards. As in the other action of that afternoon, the British ship took advantage of the fact that her guns had longer range, and she drew back from the German ships so that their guns could not reach her, though her own shells began to fall upon their decks. It was her object to keep them busy until she could be joined by her accompanying ships.

The *Cornwall* by four o'clock was also near enough to the *Leipzig* to open fire on her, and three hours later the German cruiser was having a time of it with a large fire in her hold. British faith in heavy armament with long range had again been vindicated. There was something of human interest in this duel

between the *Glasgow* and the *Leipzig*. In their previous meeting, off Coronel, the German ship had had all the better of it and now the men of the British ship were out for revenge. Consequently the *Glasgow* signaled to the other British ships: "Stand off—I can manage this myself!" By eight o'clock in the evening the *Glasgow* had her in bad condition, and the *Carnarvon* came up to assist in raking her till there was nothing left but a mass of wreckage on her decks. But her flag was still flying and the British ships kept circling around her, thinking she still wished to fight, but not coming near enough to permit the use of her torpedo tubes. Miserable was the plight of the *Leipzig's* crew, for the two hundred men who were still alive were unable to get to her flag on account of the fire aboard her, and they had to remain inactive while the *Carnarvon* and *Glasgow* poured round after round into their ship. Only twelve remained alive at nine o'clock, when she began to list to port. Slowly more and more of the under-water part of her hull showed above the sea, and she continued to heel until her keel was right side up. In this position she sank, a large bubble marking the spot.

When the *Nürnberg* left the line of German ships at one o'clock, it was the British cruiser *Kent* that went after her, a vessel more heavily armed than the German ship, yet about a knot slower. But by hard work on the part of the engineers and stokers of the *Kent* she was able, by five o'clock, to get within firing distance of the *Nürnberg*. By a strange trick of fate the *Kent* was sister ship to the *Monmouth* which had fallen victim to one of the *Nürnberg's* torpedoes in the battle off Coronel. Here, too, was a duel with human interest in it. In their desire for revenge, the men of the *Kent* made fuel of even her furniture in order to speed up her engines. Her 6-inch guns now began to strike the German ship, and soon a fire broke out aboard her. She could have ended the German vessel by keeping a fire upon her while remaining too distant to be within range of the *Nürnberg's* 4-inch guns, but dusk was gathering and an evening mist was settling down upon the water. Consequently the *Kent* drew nearer to her adversary. The firing of the *Nürnberg* was then effective and more than twenty of her shells took good effect on

the British ship. It was only through prompt action on the part of her crew that her magazine was kept from exploding, for a shell set fire to the passage leading to it. A stream from a fire hose saved her.

By seven o'clock in the evening the *Nürnberg* was practically "blind," for the flames from the fire that was raging on her had reached her conning tower. A member of her crew hauled down her flag, and the *Kent*, thinking that the fight was over, came close to her. While within a few hundred yards of her, however, she was greeted with new firing from the German cruiser. But this ceased under a raking from the *Kent's* starboard guns, and once again the flag of the *Nürnberg*, which had been run up on resumption of shooting, was hauled down. Members of her crew then had to jump into the sea to escape death from burning—the fire was quenched only when she went down at half past seven. The overworked engineers and stokers of the *Kent* were rewarded for their hard work by being permitted to come on deck to watch the *Nürnberg* go down, and all were soon engaged in helping to save the lives of the German sailors in the water. Just as the red glow of the sinking *Nürnberg* was dying down a large four-masted sailing ship, with all sails set, came out of the mist, her canvas tinged red by the flames' rays. Silently she went by, disappearing again into the mist, a weird addition to an uncanny scene.

Chasing the various units of the broken line of German ships had taken the British ships miles from each other, but after ten o'clock they began to reach each other by wireless signals and all made again for Stanley. It was not until the afternoon of the next day, however, that word came from the *Kent*, for her pursuit had taken her further than any of the other British ships.

The *Bristol* and *Macedonia* had made good in their pursuit of the *Santa Isabel* and *Baden*, but in going after the *Dresden* the *Bristol* was not successful; the German ship got away in the rain-storm which came up during the evening, and the *Bristol*, which had hurried out of the harbor at Stanley not quite ready for battle, was unable to keep on her trail. The fast *Eitel Friedrich*, which as a merchant ship converted into a man-o'-warsman, had

greater speed than any of the ships on either side, was able to get away also. These two German ships now took up their parts as raiders of Allied commerce, and were not accounted for till months later. There was now on the high seas no German squadron.

CHAPTER XXXVII

SEA FIGHTS OF THE OCEAN PATROL

THERE were some minor naval operations in the waters of Europe which have been neglected while larger actions elsewhere were recorded. During the month of September, 1914, the British admiralty established a blockade of the mouth of the River Elbe with submarines, and the German boats of the same type were showing their worth also. On August 28, 1914, the day after the raid on Libau by the German cruiser *Augsburg*, the date of the battle of the Bight of Helgoland, the two Russian protected cruisers *Pallada* and *Bayan*, while patrolling the Russian coast in the Baltic Sea, were attacked by German submarines. Surrounded by these small craft, which made poor targets, the two Russian ships sought to escape by putting on full speed, but the former was hit by a torpedo and sank. The other got away.

All of the Allies, with the exception of France, had by the beginning of September, 1914, suffered losses in their navies. The navy of the republic was engaged in assisting a British fleet in maintaining supremacy in the Mediterranean, and kept the Austrian fleet bottled up in the Adriatic Sea. French warships bombarded Cattaro on September 10, 1914, to assist the military operations of the Montenegrin Government. These ships then proceeded to the island of Lissa and there destroyed the wireless station maintained by Austria. The Austrian navy made no appearance while the Allied fleets scoured the lower coast of Dalmatia, bringing down lighthouses, destroying wireless stations, and bombarding the islands of Pelegosa and Lesina. On

the 19th of September, 1914, they returned to Lissa and landed a force which took possession of it, thus establishing a new naval base against the Central Powers' navies.

Duels between pairs of ships took place in various seas. The career of the raider *Kaiser Wilhelm der Grosse*, a fast converted liner, was ended by the British ship *Highflyer*, a cruiser, near the Cape Verde Islands, on August 27, 1914, after the former had sunk the merchantman *Hyades* and had stopped the mail steamer *Galician*. The greater speed of the German vessel was of no advantage to her, for she had been caught in the act of coaling. What then transpired was not a fight, for in armament the two were quite unequal. She soon sank under the *Highflyer's* fire, her crew having been rescued by her colliers.

The next duel took place between the *Carmania* and *Cap Trafalgar*, British and German converted liners, respectively. They met on September 14, 1914, in the Atlantic off South America. In view of the fact that at the beginning of the war these two ships had been merchantmen and had been armed and commissioned after the outbreak of hostilities, this engagement was something of the nature of those between privateersmen in the old days. In speed, size, and armament they were about equal. For nearly two hours they exchanged shots between 3,000 and 9,000 yards, and marksmanship was to determine the victory. The shots from the *Carmania* struck the hull of the other ship near the water line repeatedly, and the British commander was wise enough to present his stern and bow ends more often than the length of the *Carmania's* sides. At the end of the fight the German ship was afire and sank. Her crew got off safely in her colliers, and the British ship made off because her wireless operator heard a German cruiser, with which the *Cap Trafalgar* had been in communication, signaling that she was hastening to the liner's aid.

Only two days before this the British cruiser *Berwick* captured the converted liner *Spreewald* in the North Atlantic, where she had been trying to interrupt allied commercial vessels.

Germany kept up her policy of attrition by clever use of submarines and mines. The British battleship *Audacious*, while on patrol duty off the coast of Ireland in the early days of the war,

met with a disaster of some sort and was brought to her home port in a sinking condition. The rigors of the British censorship almost kept the news of this out of the British papers and from the correspondents of foreign papers. It was reported that she had struck a mine, that she had been torpedoed, and that she had been made the victim of either a spy or a traitor who caused an internal explosion. The truth was never made clear. Rumors that she had gone down were denied by the British admiralty some months later, when they reported her repaired and again doing duty, but this was counteracted by a report that one of the ships that was completed after the start of hostilities had been given the same name.

About the sinking of the *Hawke* there was less conjecture. This vessel had gained notoriety in times of peace by having collided with the *Olympic* as the latter left port on her maiden voyage to New York. On the 15th of October, 1914, while patrolling the northern British home waters she was made the target of the torpedo of a German submarine and went down, but the *Theseus*, which had been attacked at the same time, escaped.

Four German destroyers were to be the next victims of the war in European waters. On October 17, 1914, the *S-115*, *S-117*, *S-118*, and *S-119* while doing patrol duty off the coast of the Netherlands, came up with a British squadron consisting of the cruiser *Undaunted* and the destroyers *Legion*, *Lance*, and *Loyal*. An engagement followed, in which damage was done to the British small boats and the four German destroyers were sunk. Captain Fox, senior British officer, had been on the *Amphion* when she sank the *Königin Luise* and had been rescued after being knocked insensible by the explosion of the mine that sent the *Amphion* to the bottom.

The exploit of Lieutenant Commander Horton in the British submarine *E-9* when he sank the *Hela* has already been narrated. The same commander, with the same craft, during the first week of October, 1914, proceeded to the harbor of the German port of Emden, whence had sailed many dangerous German submarines and destroyers that preyed on British ships. He lay submerged there for a long period, keeping his men amused with

a phonograph, and then carefully came to the surface. Through the periscope he saw very near him a German destroyer, but he feared that the explosion of a torpedo sent against her would damage his own craft, so he allowed her to steam off, and when she was 600 yards away he let go with two torpedoes. The second found its mark, and the *S-126* was no more. He immediately went beneath the surface and escaped the cordon of destroyers which immediately searched for him. By October 7 the *E-9* was back in Harwich, its home port.

On the 31st of October, 1914, the cross-channel steamer *Invicta* received the S. O. S. signal and went to rescue the crew of the old British cruiser *Hermes*, which had been struck by two torpedoes from a German submarine near Dunkirk. All but forty-four of her men were saved.

The next victim of a German submarine was the gunboat *Niger*, which, in the presence of thousands of persons on the shore at Deal, foundered without loss of life on November 11, 1914. But one of the German submarines was to go to the bottom in retaliation. On the 23d of November the *U-18* was seen and rammed off the Scotch coast, and some hours later was again seen near by. This time she was floating on the surface and carrying a white flag. The British destroyer *Garry* brought up alongside of her and took off her crew, just as she foundered.

Three days later the *Bulwark*, a British battleship of 15,000 tons and carrying a crew of 750 officers and men, was blown up in the Thames while at anchor at Sheerness. It was never discovered whether she was a victim of a torpedo, a mine, or an internal explosion. It is possible that a spy had placed a heavy charge of explosives within her hull. Only fourteen men of her entire complement survived the disaster.

It was in November, 1914, also, that the sometime German cruisers *Goeben* and *Breslau*, now flying the Turkish flag, became active again. As units in a Turkish fleet they bombarded unfortified ports on the Black Sea on the first day of the month. Retaliation for this was made by the Allies two days later when a combined fleet of French and English battleships bombarded the Dardanelles forts, inflicting a certain amount of damage.

Religious dignitaries at Nikko, Japan, crossing the Red Lacquer Bridge to the temple of Iyeyasu, to announce the declaration of war to the spirits of the Imperial Ancestors

On the 18th of November, 1914, the *Goeben* and *Breslau* engaged a Russian fleet off Sebastopol. The composition of this Russian fleet was never made public by the Russian admiralty, but it is known that the Russian battleship *Evdaffi* was the flagship. She came up on the starboard side of the two German ships and opened fire on the nearer, the *Goeben*, at a distance of 8,000 yards. The latter, hit by the Russian 12-inch guns was at first unable to reply because the first shots set her afire in several places, but she finally let go with her own guns and after a fourteen-minute engagement she sailed off into a fog. Her sister ship the *Breslau* took no part in the exchange of shots, and also made off. The damage done to the *Goeben* was not enough to put her out of commission; the *Evdaffi* suffered slight damage and had twenty-four of her crew killed.

While the daring exploits of German submarines was winning the admiration of the entire world for their operations in the northern naval theatre of war, the British submarine commander, Holbrook, with the *B-11* upheld the prestige of this sort of craft in the British navy. He entered the waters of the Dardanelles on the 13th of December, 1914, and submerging, traveled safely through five lines of Turkish mines and sent a torpedo against the hull of the Turkish battleship *Messudiyeh*. The *B-11* slowly came to the surface to see what had been the result of her exploit, and her commander, through the periscope saw her going down by the stern. It was claimed later by the British that she had sunk, a claim which was officially denied by the Turks. Her loss to Turkey, if it did occur, was not serious, for she was too old to move about, and her only service was to guard the mine fields. The *B-11* after being pursued by destroyers again submerged for nine hours and came successfully from the scene of the exploit.

CHAPTER XXXVIII

WAR ON GERMAN TRADE AND POSSESSIONS

WITH the exceptions of the deeds done by the German sea raiders the remaining naval history of the first six months of the war had to do for the most part with British victories. When Von Spee's squadron was dispersed off the Falkland Islands there was no more possibility of there being a pitched fight between German and British fleets other than in the North Sea.

England began then to hit at the outlying parts of the German empire with her navy. The cruiser *Pegasus*, before being destroyed by the *Königsberg* at Zanzibar on September 20, 1914, had destroyed a floating dock and the wireless station at Dar-es-Salaam, and the *Yarmouth*, before she went on her unsuccessful hunt for the *Emden*, had captured two or three German merchantmen.

As far back as the middle of August, 1914, the capture of German Samoa had been planned and directed from New Zealand. On the 15th of that month an expedition sailed from Wellington, and in order to escape the *Gneisenau* and *Scharnhorst*, went first to French New Caledonia, where the British cruisers *Psyche*, *Philomel*, and *Pyramus* were met with. On the 23d of the month, this force, which was augmented by the French cruiser *Montcalm* and the Australian battleships *Australia* and *Melbourne*, sailed first for the Fiji Islands and then to Apia on Upolu Island off Samoa. They reached there on the 30th. There was, of course, no force on the island to withstand that of the enemy, and arrangements for surrender of the place were made by signal. Marines were sent ashore; the public buildings were occupied, the telegraph and telephone wires cut, the wireless station destroyed and the German flag hauled down, to be replaced by the Union Jack. The Germans taken prisoners were rewarded for the kind treatment they had accorded British residents before the appearance of this British force, and they were sent to New Zealand, more as guests than as prisoners.

The next German possession to be taken was that in the Bismarck Archipelago. It was known that there was a powerful wireless station at Herbertshöhen, the island known as New Pomerania. A small landing party was put ashore on the island in the early morning of September 11, 1914, and made its way, without being discovered, to the town. The surprised inhabitants were too frightened to do anything until this party left to go further on to the wireless station. By that time it met with some resistance, but overcame it. A few days later another landing party had captured the members of the staff of the governor of New Pomerania, together with the governor himself, at Bougaivilee, Solomon Islands, whence they had fled. The wireless stations on the island of Yap, in the Carolines, and on Pleasant Island were destroyed during the following month.

Perhaps the strangest operations of naval character ever performed were the inland "sea" fights in Africa. The great Nyassa Lake in Africa was the scene of this fighting. With its entire western shore in British possession and with a goodly part of its waters within the territory of German East Africa, it was not unnatural that fighting should take place there. Both countries maintained small armed vessels on the lake. The British ship *Gwendolen*, a 350-ton craft, had been built on the Clyde and had been sent to Nyassa Lake in sections and there assembled and launched in 1898. During August she fought with a German ship and captured it. The fighting on the lake could not, however, determine the success of the military operations taking place in those regions.

The preponderance of British naval strength was beginning to tell severely upon German trade by the end of 1914, and her boast that through her navy she would starve out Germany aroused the German Government greatly. In answer to these British threats, Grand Admiral von Tirpitz, German Secretary of Marine, in an interview given to an American newspaper correspondent, hinted that Germany's retaliation would be a war on British merchant ships by German submarines.

The interview at the time aroused but mild comment; the idea

was a new one, and the question immediately arose as to whether such action would be within the limits of international law. For the time being, however, Von Tirpitz's words remained nothing more than a threat. It was not until months later that the threat was made good, and the consequences must form a separate part of this narrative, to be given in Volume III.

The seaplane, the newest naval machine at the time, and as yet an untried factor, was to see maiden service first at the hands of the British, when on the 25th of December a raid on Cuxhaven was made. Seven naval seaplanes attacked a fleet of German cruisers and destroyers lying off Schilling Roads near the German port. The men who thus made history in aviation were Francis E. T. Hewlett, son of the famous novelist, accompanied by seven pilots. A naval force consisting of a light cruiser, a flotilla of destroyers and another of submarines brought up near Helgoland during the morning. When this naval force was first discovered by the lookouts on Helgoland, there immediately appeared approaching from the German base two Zeppelins and a number of German seaplanes, together with some submarines. Meanwhile, from the decks of the British craft there went up the seven British seaplanes.

In order to give them a place for landing after they returned from their raid, it was necessary for the British ships to remain in the vicinity for three hours. The *Undaunted* and *Arcthusa*, with the rest of the British force, had to "dance" about, dodging the submarines which were attacking them from beneath the surface of the water and the aircraft hovering over them. Bombs dropped from the latter failed to find their targets, and by swift maneuvering the torpedoes shot at them were also caused to go far wide of the mark.

The British airmen dropped their bombs on points of military importance at Cuxhaven, but their effect was kept secret by the German authorities. Six of the seven returned to the squadron and were picked up by submarines. Three of the seaplanes were wrecked and had to be abandoned. Fog not only prevented the British airmen from doing their best work, but it kept the marksmen on the German aircraft also from hitting the ships on the

waters beneath them. This raid had been made in answer to a great outcry that had gone up from the British public after German warships had raided the eastern coast of England.

CHAPTER XXXIX

RAIDS ON THE ENGLISH COAST

DURING the first days of November, 1914, the Germans planned and carried out a general surprise for the British navy. After the battle in the Bight of Helgoland, back in August, the British thought that Germany would continue to keep her navy within the protection of her coast defenses, perhaps forever. But such was not her intention.

On the afternoon of November 2, 1914, there gathered off some part of Germany's northern shore a squadron consisting of the battle cruisers *Von der Tann*, *Seydlitz*, and *Moltke*, the protected cruisers *Kolberg*, *Strassburg*, and *Grandenz*, the armored cruisers *Yorck* and *Blücher*, together with some destroyers. The slowest of these vessels could make a speed of 25 knots, and the fastest, the *Graudenz* and *Moltke*, could make 28 knots. The guns of the *Blücher* were the heaviest in the squadron, those of her primary battery being 12-inch cannon. Ten-inch guns were on the decks of the other ships.

The first that the rest of the world knew of the gathered force was at evening, November 2, 1914, when a fleet of British fishermen hailed them with friendly signs, thinking them British ships, not far from Lowestoft some time after six o'clock. The fishermen started at once for their home ports in order to apprise the British authorities, but they had not gone far when the news was flashed to the British admiralty office from the wireless room of the British gunboat *Halcyon*. But only the first few words of the warning were able to get through, for the wireless operators on the German ships "jammed" their keys, and a few shots from the German guns were sufficient to bring down the wireless apparatus

of the gunboat as well as one of her funnels. She turned off and made for her home port to report the news some hours later.

It was only ten miles from the British shores that the *Halcyon* had sighted the German ships, but they were able, nevertheless, to elude all British warships in those regions and proceeded to Yarmouth, firing at the wireless station, the naval yards, and the town itself. Fearing mines near the coast, the German commander did not attempt to come in too close, with the result that many of the German shots fell short, and, in spite of the fact that the bombardment lasted for nearly half an hour, the damage done by them was not great.

The inhabitants of the towns of Lowestoft and Yarmouth were asleep in the early hours of the morning when they first heard the booming of the German guns. In the darkness of the British winter they hurriedly went down to the water front, where, far out at sea, they could make out faintly the hull of but one vessel, but the red flashes from the booming guns showed that other ships were present. The crowds on the shore watched two British destroyers and two submarines, which had been lying in the harbor, put out after the German force. The latter by that time had started off, dropping in its wake a number of floating mines. This strategy resulted in the loss of the submarine *D-5*, which hit one of the mines and sank immediately. The German cruiser *Yorck* was claimed by the British to have hit a mine also, with the result that she sank and carried down with her some 300 of her crew. This was denied later by the German admiralty, and like all such controversies must remain a secret with the officials of both Governments.

Judged by material effects, this raid was a failure. But in view of the fact that the Germans had shown that a squadron could actually elude the large number of British warships patrolling the North Sea, and was actually able to strike at the British coast, it was a moral victory for Germany.

"We must see clearly that in order to fight with success we must fight ruthlessly, in the proper meaning of the word." These were the words of Count Reventlow, when he heard the news of the defeat of the German squadron commanded by Von Spee off

the Falkland Islands. As a result, and in revenge for this defeat, the German admiralty planned a second raid on the coast towns of England. The towns chosen for attack this time were Hartlepool, Scarborough, and Whitby. The first of these was a city of 100,000 persons, and its principal business was shipbuilding. Scarborough was nothing more than a seaside resort, to which each summer and at Christmas were attracted thousands of Englishmen who sought to spend their vacations near the water. Whitby, though it had some attractions for holiday crowds, such as a quaint cathedral, was at most nothing more than a home port for a number of fishing boats.

It was claimed later by the Germans that these three towns, according to the accepted definitions in international law, were fortified ports, and consequently open to attack by hostile forces. In reply the British claimed that there was nothing in any of the three which could bring them into that category. This controversy is still another which must remain undecided. There is, however, the fact that the information which the German Government had obtained about them, and which it made public, must necessarily have been less comprehensive than that supplied to the world at large by the British authorities. Guidebooks, as well as tourists who have visited the place, reported that an old castle stood in Scarborough which in past centuries had been a fort, but which at the outbreak of the war was nothing more than a show place. The only gun in place at the castle was an obsolete piece that had seen service in the Crimean War. Whitby, in times of peace, at least, had not even such "armament."

It was on the 16th of December, 1914, that this second raid took place. Over the North Sea there hung a light mist. The German admiralty did not afterward make public the names of the cruisers which participated in this expedition, but they are believed to have been the *Derfflinger*, *Blücher*, *Von der Tann*, *Seydlitz*, and *Graudenz*. It was at eight o'clock in the morning that the residents of the three English towns first heard the booming of the German guns, and coast guards near by were able, with the aid of very strong glasses, to make out the hulls of the attacking cruisers some miles out to sea. It was not thought

possible that the Germans could again elude the British ships on patrol in these waters, and the guards therefore thought that the firing came from ships flying the Union Jack and tried to signal to them. But they came to realize the truth when they received no answering signals.

As it was not known but that the Germans would make an attempt to land, the guards in the obsolete fort at Hartlepool took their positions and two small patrol boats in the harbor made ready to give what resistance they could. These, the *Doom* and the *Hardy*, drew the fire of the German guns, and, seeing it was impossible to withstand the German fire, they made off and escaped. This time the Germans were better informed about the conditions they dealt with, and evidently had no fear of mines, for they came to within two miles of the shore. The forts on shore were bombarded and private houses near by were hit by German shells, killing two women who lived in one of them. The forts tried to reply to the German guns, but those of the English battery were by no means modern, and firing them only served to further convince the Germans that the place was fortified; they inflicted no damage on the German ships.

The lighthouse was the next target chosen by the Germans, one of their shells going right through it, but leaving it standing. Within fifty minutes 1,500 German shells were fired into the town and harbor. While two of the three cruisers which were engaged in bombarding drew off further to sea and fired at Hartlepool, the third remained to finish the battery on shore, but in spite of the fact that it was subjected to long and heavy firing, it was not so terribly damaged. Many of the shells from the other two ships went over the towns entirely and buried themselves in the countryside that heretofore had been turned up only by the peaceful plow. Other shells did havoc in the business and residential sections of Hartlepool and West Hartlepool, bringing down buildings and killing civilians in them as well as on the streets.

At about the same hour the coast guards near Scarborough reported the approach of foreign ships off the coast, and then telephoned that the strangers were German cruisers and that

they had begun to bombard the town. A German shell destroyed the shed from which the telephone message had come and the warnings from it ceased. It was seen by those on shore that the attack here was being made by four ships, two of them cruisers and two of them mine layers, only 800 yards out in the water. This time they were not handicapped by the fact that they had to stand out so far from shore, and it was a surprise to the natives to see ships of such draft come so close to land—a fact which convinced the British authorities that spies had been at work since the first raid, sending to the German admiralty either charts or detailed descriptions of the region.

The castle was badly damaged by their fire; the town itself came next, the Grand Hotel coming in for its share of destruction. They did little injury to a wireless station in the suburbs, but hit quite a number of residences, the gas and water works.

Half an hour afterward the two cruisers which had fired upon Scarborough appeared off Whitby and began to fire at the signal station there. In the ten minutes that the bombardment of Whitby lasted some 200 shells fell into the place. This time the fact that the German ships came close to the shore worked against them, for there are high cliffs close to the water at the spot and it was necessary for the German gunners to use a high angle, which did not give them much chance to be accurate. The German ships next turned seaward and made for their home ports.

The scenes enacted in the three towns during the bombardment and afterwards were tragic. Considering the fact, however, that the persons under fire were civilians, many of them women and children, their coolness was remarkable. They did not know what should be done, for the thought of bombardment was the last thing that had come into the minds of the authorities when England went to war, and as a result no instructions for such an emergency had been issued by the authorities. Some thought it best to stay within doors, some thought it best to go into the streets. In Hartlepool a large crowd gathered in the railway station, some fully dressed, some only in night clothes.

Many of the women carried babies in their arms and were followed by older children who clung to their skirts. Policemen

led this crowd out of the station and started them along a street which would bring them out into the country, but while they were passing the library they were showered by the stone work as it fell when hit by the German shells. One shell, striking the street itself, killed three of the six children who were fleeing along it in company with their mother. Many other persons met deaths as tragic either within their own homes or on the streets. St. Mary's Catholic Church as well as the Church of St. Hilda were damaged, as were the shipyards and the office of the local newspaper. The destruction of the gas works left the town in almost complete darkness for many nights afterward. The authorities issued a proclamation ordering all citizens to remain indoors for a time, and then began to count the number of dead and injured. The first estimate gave the former as 22 and the latter as 50, but subsequent reckoning showed that both figures were too low.

In Scarborough most of the inhabitants were still in bed when the bombardment started and for a few minutes did not become excited, thinking the booming of the guns was the sound of thunder. But when the shells began to drop on their houses they knew better. Many were killed or wounded while they hastily got into their clothes. One shell hit St. Martin's Church while communion was being held. Here, too, the railway station was made the objective of many refugees, and the police did what they could to send the women and children out of range of fire by putting them on trains of extra length. As in all such scenes there were humorous sides to it. One old workman, while hurrying along a street was heard to say: "This is what comes of having a Liberal Government." In all, about 6,000 people left the town immediately and did not return for some days.

Similar were the scenes enacted in Whitby when the turn of that town came. Only two persons were killed in that town, while thirteen casualties were reported from Scarborough.

The raid immediately became the subject for discussion in the newspapers of every country on the globe. In England it was bitterly denounced, and the term "baby killers" was applied to the men of the German navy. In Germany it was justified on the

grounds that the German admiralty had information and proof that the bombarded cities were fortified, and therefore, under international law, subject to bombardment. Nor did the German journalists lose the opportunity to declare that Great Britain no longer ruled the waves nor to show pride over the fact that their fleet had successfully left the German coast and had successfully returned to its home port. The war, they said—and truthfully—had been brought to England's door.

The year 1914 ended gloomily for the British public; nothing could have disappointed them more than the failure to catch the Germans. Nor did the new year open brightly for Britain, for on the first day of January, 1915, there came the news of disaster to the *Formidable*, sister ship to the *Bulwark*. The lesson of the *Hogue*, *Cressy*, and *Aboukir* had not been learned, for this ship went down under the same circumstances. While patrolling near Torbay during a night on which there was a bright moon and a calm sea, this ship, in company with seven other large ships unaccompanied by a "screen" of destroyers, was hit by a torpedo fired from a German submarine. Most of her crew were asleep when the torpedo struck and damaged the engine room so much that no lights could be turned on. In the darkness they hurried to the deck, which was slanting from her list. In obedience to orders issued by the admiralty after the sinking of the *Cressy* and the ships with her, the rest of the fleet immediately sailed away from the scene, so that no more of them would be hit. Only a light cruiser stood by the sinking *Formidable*. A second torpedo struck her and this had the effect of letting water into her hold on the side which was slowly coming out of the water. She took a position with even keel after that, and this fact enabled most of her crew to get off safely before she sank.

Once more the Germans were to attempt a raid on the coast cities of England. The date of this third attempt was January 24, 1915. This time the British were a bit better prepared, for a squadron of battle cruisers, consisting of the *Lion*, *Tiger*, *Princess Royal*, *New Zealand*, and *Indomitable*, put out from a port in the north of England at about the same time that the Germans left their base. All of these ships, with the

exception of the last named, were quite fast, having speeds of from 25 to 28.5 knots; they were at the same time carrying heavy armament—13.5-inch guns in the main batteries. In company with them went four cruisers of what is known in England as the "town class"; these were the *Nottingham*, *Birmingham*, *Lowestoft*, and *Southampton*, together with the three light cruisers *Arethusa*, *Aurora*, and *Undaunted*, and a squadron of destroyers. The German fleet which was engaged in this raid consisted of the *Seydlitz*, *Moltke*, *Derfflinger*, and *Blücher*, in company with a fleet of destroyers. The German ships were not quite as fast as the English ships, nor did they carry guns of such range or destructive power as their British opponents.

Early in the first hours of January 24, these two forces, unknown to each other were steaming head on, the Germans taking a course leading northwest and the English a course leading southeast. At twenty minutes past seven in the morning the *Aurora* first sighted the enemy and engaged him immediately with her 6-inch guns, sending at the same time word of her discovery to Admiral Beatty. Admiral Hipper, the German commander, as soon as as he knew the enemy had sighted him, turned about and started to steam in a southeasterly direction.

In view of the results of this battle, it is best to go into the matter of the tactics involved. Tactics may be of two kinds—spontaneous or premeditated. When two hostile fleets meet on the high sea far from the base of either, the object of each is the complete destruction of the other, and the tactics employed are spontaneous. Such an action was that off the Coronel. But on a closed sea such as the North Sea spontaneous tactics can rarely be used, for the reason that naval bases are too near, and from these there may slyly come reenforcements to one or the other or to both of the fighting fleets, making the arrangement of traps an easy matter. This is particularly true of the North Sea, on which it is possible for a fleet to leave Cuxhaven early in the evening and to be at Scarborough early the following morning. In addition, sailing is restricted because an unusually large portion of its waters is too shallow to permit of the passage of large ships.

The Germans on this occasion had arranged a trap. They

knew that after making two successful raids on the English coast the British would keep even a closer watch for them. When they sailed from their base, it was with the expectation of meeting a hostile force, as was undoubtedly their expectation on the first two raids. But they did not intend to fight matters out on high waters. What they wanted to do was to get the British involved in a good running engagement, steering a southeasterly course the while and luring the British ships within striking force of a waiting fleet of superdreadnoughts and perhaps land guns and mines. This explains why Admiral Hipper turned stern as soon as he got into touch with the enemy.

There was a distance of fourteen miles between the two fleets when the *Lion* got her heavy guns into action. The German line was off her port (left) bow. At the head of that line was the *Moltke*, and following her came the *Seydlitz*, *Derfflinger*, *Blücher*, and the destroyers in the order given. At the head of the British line was the *Lion*, followed by the *Tiger*, *Princess Royal*, *New Zealand*, and *Indomitable* in the order named. The other cruisers and the destroyers of the British fleet brought up the rear. In the chase which followed the Germans were handicapped by the fact that the *Blücher* was far too slow to be brought into action, which meant that either the other ships must leave her behind to certain destruction or that they must slow down to keep with her. They chose the latter course, while her stokers did their best to increase her speed. In the English fleet there was the same trouble with the *Indomitable*, but inasmuch as the British were the pursuers and had a preponderance in ships and in the range of their guns, this did not matter so much to them. But the stokers of the *Indomitable* worked as hard, if not harder, than those of the *Blücher*.

By half past nine the two forces were seven miles apart and the battle was on. It is necessary here to give certain facts about gunnery on a large modern battleship. Firing at a range of seven miles means a test of mathematics rather than of the mere matter of pointing guns. At that distance the target—the ship to be hit—is barely visible on the sky line on the clearest and calmest sea. If a hole the size of the head of a pin be made

in a piece of cardboard and the latter he held about a foot and a half from the eye, the distant ship will just about fill the hole.

The guns on the modern battleships are not "laid"; that is, they are not aimed as were the cannon of past days or the rifle of to-day. It is set toward its target by two factors. The first is known as "traverse," which means how far to the left or right it must be pointed in a horizontal plane. The second factor is "elevation"—how far up or down it must be pointed in a vertical plane. The latter factor determines how far it will throw its projectile, and up to a certain point the higher the gun is pointed the further will go the shell. A certain paradox seems to enter here. It is a fact that a distant ship presents a target more easily hit if its bow or stern is toward the gunner. If it presents a broadside there is the danger that the shells will go either beyond the ship or will fall short of it, for the greatest beam on a warship is not much more than 90 feet. If the bow or stern is toward the gunner he has a chance of landing a shell on any part of the 600 or more feet of the ship's length. The first firing in a battle at a distance is known as "straddling," by which is meant that a number of shots are sent simultaneously, some falling short, some falling beyond the target, and some hitting it.

The man who really "aims" the gun never sees what he is shooting at. At some point of vantage on his ship one of the officers observes the enemy and reports to the chief gunner the distance, the direction, and the effect of the first shots. The gunnery officer then makes certain calculations, taking into consideration the speed of his own ship and the speed of the enemy ship. He knows that at a given moment his target will be at a given point. He knows also just how fast his shells will travel and makes calculations that enable him to place a shell at that point at just the right second. In this battle the shells of the British ship took about twenty seconds to go from the mouths of the guns to the German hulls. And they made a curve at the highest point of which they reached a distance of more than two miles; and most wonderful of all was the fact that at the beginning of the firing a man standing on the deck of one of the German

ships could not even see the ship which was firing the shells at her, though the weather was very clear.

By a quarter to ten o'clock the *Lion* had come up with and had passed the slow *Blücher*, firing broadsides into her as she went by. The *Tiger* then passed the unfortunate German ship, also letting her have a heavy fire, and then the *Princess Royal* did likewise. Finally the *New Zealand* was able to engage her and later even the slow *Indomitable* got near enough to do so. By that time the *Blücher* was afire and one of her gun turrets, with its crew and gun, had been swept off bodily by a British shell.

Meanwhile the *Lion*, *Tiger*, and *Princess Royal* kept straight ahead till they were able to "straddle" even the leading ship of the enemy's line. The *Tiger* and *Lion* poured shells into the *Seydlitz*, but were unable to do much damage to the *Moltke*. While they were thus engaged the *Princess Royal* singled out the *Derfflinger* for her target. The light British cruiser *Aurora*, *Arethusa*, and *Undaunted* were far ahead of the rest of the British fleet and were firing at the *Moltke*, but thick black smoke which poured from their funnels as their engines were speeded up got between the gunners of the *Lion* and their target, the *Moltke*, completely obscuring the latter. As a result the three light British cruisers were ordered to slow down and to take positions to the rear.

By eleven o'clock there were fires raging on both the *Seydlitz* and the *Derfflinger*, and Admiral Hipper decided to try to save his larger ships by sacrificing the destroyers that accompanied them. Consequently the German destroyers put their bows right toward the large British ships and charged, but the fire which they drew was too much for them and they gave up this maneuver.

The British destroyer *Meteor*, which had been maintaining a perilous position between the battleships, then attempted to torpedo the *Blücher*, which had fallen far to the rearward to be abandoned by the rest of the German fleet. Badly damaged as the *Blücher* was, the crew of one of her guns managed to get in some final shots, one of them nearly ending the career of the British destroyer. The *Arethusa* had also come up and prepared

to launch a torpedo. Cruiser and destroyer torpedoed her at about the same moment, and later, while within 200 yards of the sinking German ship the *Arethusa* sent another torpedo into her. She now began to list heavily on her port side till her keel showed. Her crew showed remarkable bravery.

The men lined up as though at a review and began to sing the German national airs, intending to go to their deaths in that formation. But an officer on the *Arethusa* shouted to them through a megaphone to jump while they could to save their lives. This had a psychological effect, and as the starboard side of her hull slowly came up her men were seen scrambling on it from behind her taff rail and creeping down toward her keel. Some of them almost walked into the water while she was in that position. Her guns were pointing toward the sky, one of them slowly revolving. Finally, when she was completely upside down she went under. Many of her crew were picked up by British small boats, and her captain, who was one of them, was taken to England, where he died later from the results of this experience and was buried with full naval honors.

The German destroyers had meanwhile come between their own cruisers and those of the enemy and emitted volumes of heavy smoke, which they hoped would form an effective screen between the former and the gunners on the latter. Admiral Hipper then ordered all of his ships to turn northward, in the hope of getting away behind this screen, but the British admiral anticipated this maneuver and changed the course of his ships so that he again had the German ships in view after both fleets had driven through the smoke.

The *Lion* of the British fleet was chosen as the target for the German ships, and by keeping a concentrated fire upon her were able to do considerable damage. One shell penetrated the bow of the *Lion* as it was partly lifted out of the water on account of the great speed she was making; this shot hit her water tank and made it impossible for her to use her port engine from that time on. She slowed down. When she fell out of the line it was necessary for Admiral Beatty to leave her, and he transferred his flag to the destroyer *Attack*. But all of this took time and it was quite

long before he was able to rejoin his leading ships. By twenty minutes past twelve he had got aboard the *Princess Royal*.

Rear Admiral Moore automatically took up command of the British fleet while his senior officer was making these changes. It is not known what Admiral Moore's orders had been, but it is known that he suddenly ordered all ships to cease firing and allowed the German warships to proceed without further engaging them. By the time that Admiral Beatty was again on a battle cruiser the action was virtually over. The *Indomitable* passed a cable to the crippled *Lion* and towed the latter home, the rest of the British fleet keeping to the rearward to be ready for possible resumption of fighting.

Much criticism was made by the British press and by laymen on account of the sudden termination of the fight, and there was great complaint in England because the career of all the raiding German ships had not been brought to an end. But when the engagement ended the opposing fleets were within seventy miles of Helgoland, and the German admiralty had ready a fleet of dreadnoughts and another of battle cruisers to engage the British ships when they got within striking distance. By ending the fight when he did the British commander chose not to be led into this trap. Nor was there dissatisfaction in England alone. In Germany the complaint was that the ruse had not worked, and not long afterward Admiral von Ingenohl was replaced as commander of the High Sea Fleet by Admiral von Pohl. None of the blame for the failure was laid at the door of the officer who had actually been engaged in the fighting—Admiral Hipper—which showed that his senior officers had considered the engagement as part of a larger action.

CHAPTER XL

RESULTS OF SIX MONTHS' NAVAL
OPERATIONS

THE first six months of naval operations in the Great War came to a close without battle between the main fleets of the navies of the warring nations. The British navy had kept open communication with the Continent, allowing the Expeditionary Force, as well as later military contingents, to get to the trenches in Flanders and France. It had, in addition, made possible the transportation of troops from Canada and Australia. The ports of France were open for commerce with America, which permitted the importation of arms and munitions, and the same privilege had been won for the ports in the British Isles.

The northern ports of the Central Powers were closed to commerce with all but the Scandinavian countries, and the over-sea German possessions, where they were accessible to naval attack, had been taken from her. The German and Austrian flags had been swept from the seven seas, with the exception of those on three or four German cruisers that now and then showed themselves capable of sinking a merchantman.

In the four engagements of importance which had been fought by the end of January, 1915, the British had been the victors in two—the battles of the Bight of Helgoland and the Falkland Islands—the Germans had been victors in one—the fight off Coronel, and the fourth, the third German raid of January 24, 1915, was a draw.

British and other allied ships were unable to inflict damage on the coast defenses of Germany, but the latter in two successful raids had been able to bombard British coast towns, offsetting in a way the loss of oversea dominions.

Great Britain, after six months of naval warfare had lost three battleships, the *Bulwark*, *Formidable*, and *Audacious*;* the five armored cruisers *Aboukir*, *Cressy*, *Hogue*, *Monmouth*, and

* The British admiralty did not clear up the mystery of her disaster.

Good Hope; the second-class cruisers *Hawke* and *Hermes*; the two third-class cruisers *Amphion* and *Pegasus*; the protected scout *Pathfinder* and the converted liner *Oceanic*; losses in destroyers and other small vessels were negligible.

Germany had lost no first-class battleships, but in third-class cruisers her loss was great, those that went down being the eleven ships *Ariadne*, *Augsburg*, *Emden*, *Graudenz*, *Hela*, *Köln*, *Königsberg*, *Leipzig*, *Nürnberg*, *Magdeburg*, and *Mainz*; she lost, also, the four armored cruisers *Blücher*, *Scharnhorst*, *Gneisenau*, and *Yorck*; the old cruiser *Geier* (interned); the three converted liners, *Spreewald*, *Cap Trafalgar*, and *Kaiser Wilhelm*; and the mine layer *Königin Luise*.

The German policy of attrition had not taken off as many ships as had been lost by Germany herself, and, as England's ships so far outnumbered her own, it may well be said that the "whittling" policy was not successful. She made up for this by having still at large the cruiser *Karlsruhe* which damaged a great amount of commerce, and by the exploits of her submarines, far outshining those of the Allies.

Russia had lost the armored cruiser *Pallada*, and the *Jemchug*, a third-class cruiser, and the losses of the French and Austrian navies were not worth accounting. With regard to interned vessels both sides had losses. While the Germans were unable to use the great modern merchantmen which lay in American and other ports, and had to do without them either as converted cruisers or transports, the Allies were forced to detail warships to keep guard at the entrance of the various ports where these interned German liners might at any moment take to the high seas.

In naval warfare the number of ships lost is no determining factor in figuring the actual victory—the important thing being the existence or nonexistence of the grand fleets of the combatants after the fighting is finished. Viewed from such an angle, the fact that the Allies had left no German ships at large other than those in the North Sea, cannot entitle them to victory at the end of the first six months of war. So long as a German fleet remained intact and interned in neutral ports, naval

victory for the Allies had not come, though naval supremacy was indicated.

The fact was apparent, moreover, that while the Central Powers were being deprived of all their trade on the seas, the world's commerce endangered only by submarines was remaining wide open to the Allies.

PART III—THE WAR ON THE EASTERN FRONT

CHAPTER XLI

GENERAL CHARACTERISTICS OF THE THEATRE OF WARFARE

WORLD war—the prophecy of the ages—now threatened the foundations of civilization. Whether or not the modern era was to fall under the sword, as did the democracy of Greece and the mighty Roman Empire, was again to be decided on battle grounds that for seventy centuries have devoured the generations. The mountain passes were once more to reverberate with the battle cry—the roar of guns, the clank of artillery, the tramp of soldiery. The rivers were to run crimson with the blood of men; cities were to fall before the invaders; ruin and death were to consume nations. It was as though Xerxes, and Darius, and Alexander the Great, and Hannibal, and all the warriors of old were to return to earth to lead again gigantic armies over the ancient battle fields.

While the war was gaining momentum on the western battle grounds of Europe, gigantic armies were gathering in the East—there to wage mighty campaigns that were to hold in the balance the destiny of the great Russian Empire, the empire of Austria, the Balkan kingdoms—Serbia, Montenegro, Rumania, Bulgaria. The Turks were again to enter upon a war of invasion. Greece once more was to tremble under the sword. Even Egypt and Persia and Jerusalem itself, the battle grounds of the Assyrians, the Babylonians, and the Trojans, the bloody fields of paganism

and early Christianity, were all to be awakened by the modern trumpets of war.

Before we enter upon these campaigns in the East it is well to survey the countries to be invaded, to review the battle lines and travel in these pages over the fighting ground.

The eastern theatre in the first six months of the war, from August 4, 1914, to February 1, 1915, includes the scenes of the fighting in the historic Balkans and in the Caucasus. But the eastern front proper is really that region where the Teutonic allies and the Russians opposed each other, forming a fighting line almost a thousand miles long. It stretches from rugged old Riga on the shores of the Baltic Sea in the far north, down through Poland to the Carpathian Mountains, touching the warm, sunlit hills on the Rumanian frontier. When the total losses of the Great War are finally counted it will probably be found that here the heaviest fighting has occurred.

This is the longest battle line in the world's history. Partly on account of its great length, and partly because of the nature of the country, we see the two gigantic forces in this region locked together in their deadly struggle, swaying back and forth, first one giving way, then the other. This was especially the case in the northern section, along the German-Russian frontier.

As we view the armies marshaling along this upper section, along the Baltic shore, southward, including part of East Prussia as well as Baltic Russia, we look upon the ancient abode of the Lithuanians, supposed to be the first of the Slavic tribes to appear in Europe. Hardly any part of Europe has a more forbidding aspect than this region. There the armies must pass over a flat, undulating country, almost as low in level as the Baltic, and therefore occupied in large part by marshes and lagoons through which they must struggle. In all parts the soil is unproductive. At one time it was a universal forest: thick, dark, and dank. A century ago, however, Catherine the Great distributed large areas of this comparatively worthless land among her favorites and courtiers. In this way a certain percentage was reclaimed, and with the incoming of the sunlight

THE WAR IN THE EAST—THE RELATION OF THE EASTERN COUNTRIES TO GERMANY

more favorable conditions for human life were established. Yet even now it is very thinly settled.

Through this region the armies must cross big rivers: the Oder, Dvina, Warthe, Vistula, Pregel, and Niemen, northward and northeastward. Just above or eastward of that point, where the German-Russian frontier touches the shore, the Baltic curls into a dent, 100 miles deep, forming the Gulf of Riga. Near the southern extremity of this gulf, eight miles from the mouth of the Dvina, is the city of Riga, ranking second only to Petrograd in commercial importance as a seaport, and with a population of about 300,000.

As the armies move across the frontier they come to a vast domain projecting into this marsh country, like a great, broad tongue licking the shore of the Baltic; this wide strip of German territory is East Prussia—a country to be beleaguered. Not far below the tip of this tongue, about five miles from the mouth of the Pregel River in the Frische Haff, and about twenty-five miles from the seacoast, is situated another embattled stronghold—the city of Königsberg which, since 1843, has been a fortress of the first rank. These two cities in the following pages will be the immediate objectives of the enemy forces operating on this section of the eastern front.

It will be obvious why the lines of battle were less permanently fixed here than in the more solid and mountainous sections of northern France. Railroads and fairly well-laid highways do indeed traverse these swamps in various parts, especially in German territory, but trenches could not be dug in yielding mire. In yet another feature were the military operations hampered by the nature of the terrain here; the use of heavy artillery.

We have seen that one of the chief causes of success attending German attacks in the other theatres of the war has been their use of heavy guns. But in the fighting before Riga, we shall see when the Germans seemed on the point of taking that city their heavy artillery was so handicapped that it was rendered practically useless. Being restricted by the marshes to an attack over a comparatively narrow front, they were compelled to leave their heavy guns behind on firmer soil. The guns which they could

take with them were matched by the Russians; the fighting was, therefore, almost entirely limited to infantry engagements, in which the Russians were not inferior to the Germans. Thus, we shall find the German advance on Riga was stopped before it could attain its object.

In studying the fighting in this part of the eastern front, it will be seen why the Germans were more successful below Riga, and why the Russians were compelled to evacuate Vilna. Here is a broad rise, something like the back of a half-submerged submarine, which seems to cross the country, where the land becomes more solid. The armies must move, instead of through marshes, along innumerable small lakes, most of the lakes being long and narrow and running north and south, with a fairly thick growth of timber among them, mostly pine and spruce and fir. In character this section is rather similar to parts of Minnesota. There are two cities to be conquered in this drier region, Dvinsk, and, further south, Vilna, once the chief city or capital of the Lithuanians. We shall see the Russians thrust back from Königsberg, and the heavy fighting shifted over to this section; yet even here, where the huge guns of the Germans could find footing, the terrain was not suited to trench warfare, and every arrival of reenforcements on either side would swing the lines back or forth.

In studying the military movements in a country of this character, special attention must be paid to the railway lines. Railways, and more especially those running parallel to the fronts, are absolutely necessary to success. In looking, therefore, for a key to the object of any particular movement, the first step must be a close study of this railroad situation.

We find from Riga to the fortress of Rovno there is a continuous line of railroad, running generally north and south and passing through Dvinsk, Vilna, Lida, Rovno, and thence down through Poland to Lemberg. Every effort of the Russian armies in the succeeding chapters will be made to keep to the westward of and parallel to this line, and for a very good reason.

Feeding into this great north and south artery are the branch lines from Petrograd to Dvinsk; from Moscow to the junction at

Baranovitschi; from Kiev to Sarny. Aside from these three important branch lines, there are a few other single-track off-shoots, but from a military point of view they are of no importance.

This line was the main objective (short of capturing Riga itself) of the German operations. This line proves especially vital to the Russians, for nowhere east of it is there another such line which could be used for the same purpose.

If, in the campaigns to be described, this railroad falls into Russian hands, it gives every facility for strengthening or reinforcing any part of the Russian front where German pressure becomes excessive. It is, in addition, a solution to the difficult problem of transportation of supplies. To use a military term, it gives the Russian army a mobility not possessed by the enemy because of a lack of similar facilities.

But should this railroad be taken by the Germans, the advantage would immediately be reversed. And if once the Russian lines were driven back beyond the railroad, a division of their forces would be forced upon them; their armies would be obliged to group themselves beside the three east and west branches already mentioned, for only by these three systems could their forces be supplied, lateral communications being absolutely lacking. And this is the key to the fighting, not only in the northern section of the front, but all along the line, down to Galicia. Naturally, only the Russian railroads need be considered, for in the first months of the war the Germans are the invaders in the northern half of the eastern front, except for a few short periods in the beginning. Compared to the German railway lines near the frontier, the Russian lines are very few.

There are two distinct railway lines running from Germany into East Prussia, with innumerable branches leading to all points of the Russian frontier, laid especially for military purposes. It was along these that we shall witness the German forces rushed from Belgium to drive back the first Russian advance. But, of course, the moment the Germans enter Russian territory they have no advantage over the Russians, since even

their wonderful efficiency does not enable them to build railroads as fast as an army can advance. Hence, we observe their efforts to gain possession of the Russian railroads.

We come now to the central part of the eastern front. Here, just below East Prussia, Russian Poland projects into German territory in a great salient, about 200 miles wide and 250 long, resembling a huge bite in shape.

This land is a monotonous, wind-swept plain, slightly undulating, its higher parts not even 500 feet above sea level. To the northward and eastward it descends gradually into the still lower lands of East Prussia and White Russia, but in the south it lifts into the foothills of the Carpathian Mountains.

Gigantic armies are to move over this plateau, timbered in parts with oak, beech, and lime, and in some sections deeply cut by small rivers and streams forming fissures, some narrow and craggy, others broad and sloping with marshy bottoms. Toward the south the soldiers must cross narrow ravines in all directions, often covered with wild, thick undergrowth. The chief river is the Vistula, which enters by the southern boundary and flows first north, then northwest, skirting the plateau region at a height of 700 feet, finally making its exit near Thorn, thence on to the Baltic through East Prussia. Its valley divides the hilly tracts into two parts: Lublin heights in the east and the Sedmierz heights to the westward. Picture in your mind the great armies approaching these ridges, the most notable of which is the Holy Cross Mountains, rising peaks almost 2,000 feet above sea level.

The fighting forces in the northeast, where the plain slopes gradually into the Suwalki Province, must pass over a country dotted with lakes and lagoons, which farther on take on the character of marshes, stagnant ponds, peat bogs, with small streams flowing lazily from one to the other. Here and there are patches of stunted pine forests, with occasional stretches of fertile, cultivated soil. Throughout this section many rivers flow along broad, level valleys, separating into various branches which form many islands and, during the rainy seasons, flood the surrounding country.

Farther west the armies pass through broad valleys or basins, once the beds of great lakes, whose rich, alluvial soil give forth abundant crops of cereals. Here, too, flows the Niemen, 500 miles in length, watering a basin 40,000 square miles in area and separating Poland from Lithuania. It advances northward in a great, winding pathway, between limestone hills covered with loam or amid forests, its banks rising to high eminences in places, past ruined castles built in the Middle Ages. In the yellowish soil along its banks grow rich crops of oats, buckwheat, corn, and some rye. Naturally such a section would be thickly populated, not only on account of the fertile soil, but because the Niemen, like the Vistula, is one of the country's means of communication and transportation. As many as 90,000 men earn their livelihoods in navigating the steamers and freight barges passing up and down this great waterway. At Yurburg the Niemen enters East Prussia on its way to the Baltic.

CHAPTER XLII

THE STRATEGIC VALUE OF RUSSIAN POLAND

IT is in the southern part of Russian Poland, among the foothills of the Carpathians, that the armies come into possession of its mineral resources, a fact which will have some influence on the German military movements in this region. Up in the Kielce hills copper has been mined for 400 years, though the output of these mines has been decreased on account of the much greater quantity found in America. A hundred years ago the Kielce mines produced nearly 4,000 tons of copper a year. Brown iron ore is also found here in deposits 40 per cent pure, while there are also veins of zinc sometimes 50 feet thick, yielding ore of 25 per cent purity. Sulphur, one of the ingredients for the manufacture of explosives, is found at Czarkowa in the district of Pinczow. In the southwest, in Bedzin and Olkuz, there are

coal deposits about 200 square miles in area. In the southern districts wheat is also grown in some abundance.

The military value of this country is further enhanced by political conditions. Like the greater part of Galicia to the southward, it is peopled by the Poles, who form one of the important branches of the great Slavic family. At one time Poland was a kingdom whose territory and possessions spread from the Carpathians up to the Baltic and far into the center of Russia, ruling its subject peoples with quite as much rigor as the Poles have themselves been ruled by Russia and Germany.

Poland is a seat of conquest in the Great War. For not much over a hundred years ago what remained of this old kingdom was divided among the three great powers: Prussia, Austria, and Russia. Austria, on the whole, has been much the best master. Germany tried in various ways to Germanize her subjects in German Poland, thereby rousing their bitter hatred. Russia was no less autocratic in attempting to extinguish the spirit of nationality among the Poles under her rule. But, naturally, the fact remains that between the Poles and the Russians there are still ties of blood. In moving westward, by this route Russia would be moving among a race who, in spite of all they had suffered at the hands of the Czar, still would naturally prefer Slav to Teuton.

We shall soon stand with the invading armies in the center of Russian Poland, and enter the great city of Warsaw. This conquered citadel with more than 400,000 inhabitants, is situated on the Vistula. It was, next to Paris, the most brilliant city of Europe in the early part of last century. But under Russian influence it became a provincial town in spirit, if not in size. It once had the character of prodigal splendor; within late years it became a forlorn, neglected city, not the least effort being made by the Russian authorities to modernize its appearance and improvement. From a sanitary point of view it became one of the least progressive cities of Europe. And yet, as the armies march into the capital, there are still signs of the city's past glory: over thirty palaces rear their lofty turrets above the tile roofs of the houses, among them the palace of the long-dead Polish kings.

However, from a military point of view, Warsaw maintained great importance in the Great War. It is at this time one of the strongest citadels of Europe, and around it lies the group of fortresses called the Polish Triangle. The southern apex is Ivangorod on the Vistula; the eastern, Brest-Litovsk; the northern being Warsaw itself. To the northwest lies the advanced fort of Novo Georgievsk. This triangle is a fortified region with three fronts: two toward Germany and one toward Austria, and the various forts are fully connected by means of railroads.

It would appear, therefore, that Russian Poland would offer excellent conditions for an army on the defensive. And this is quite true, the Vistula, especially, serving as a screen against the attacking armies from the west. As a matter of fact, it would have been extremely difficult to take Warsaw by a frontal attack. Warsaw's weakness lay in the north in the swamp regions.

One of the greatest dangers in all wars, against which a military commander has to guard his army, is that of being flanked. The road or roads leading from the rear to the base of supplies, along which not only food supplies for the soldiers, but, quite as important, ammunition, is brought up, either in wagons, automobiles, or in railroad trains, are the most sensitive part of an army's situation. Unless they are very short—that is, unless an army is very close to its base of supplies—it is impossible to guard these lines of communication adequately. Therefore, if the enemy is able to break through on either side of the front, there is great danger that he may swing his forces around and cut these lines of communication. The army that is thus deprived of its sources of supply has nothing left then but to surrender, sometimes even to inferior forces. Sometimes, of course, if the army is within the walls of a fortified city and is well supplied with food and ammunition, it may hold out and allow itself to be besieged. This may even be worth while, for the sake of diminishing the enemy's strength to the extent of the forces required for besieging, usually many times larger than the besieged force. But in the case of Warsaw we shall see that that would not have been a wise plan; hardly any food supply that could have been laid by would have maintained the large civil population, and

the big guns of the Germans would soon have battered down the city's defenses.

This the Russians realized from the very beginning. As is well known now, Russia had never intended to hold Poland against the Teutons. Her real line of defense was laid much farther back. It was only on account of the protest of France, when the two Governments entered into their alliance, that any fortifications at all were thrown up in Poland. A real line of defense must be more or less a straight line, with no break. And the marshes in the north, as well as the tongue of East Prussia projecting in along the shores of the Baltic toward Riga made that impossible. Russia's real line of defense was farther east, along the borders of Russia proper and along the line of railroad already referred to. By studying this territory east of Poland it will become obvious why Russia should prefer this as her main line of defense against a German invasion.

As we witness the armies moving along what was once the frontier between Poland and Russia proper we shall find the plain of Poland dips into a region which apparently was once a vast lake which drained into the Dnieper, but the outlet becoming choked, this stagnant water formed into those immense morasses known as the Pripet Marshes, forming over two-fifths of the whole province of Minsk and covering an area of over 600 square miles. Even when more than 6,000,000 acres have been reclaimed by drainage, the armies found some of these marshes extending continuously for over 200 miles. In the upper Pripet basin the woods were everywhere full of countless little channels which creep through a wilderness of sedge. Along the right bank of the Pripet River the land rises above the level of the water and is fairly thickly populated. Elsewhere extends a great intricate network of streams with endless fields of bullrushes and stunted woods. Over these bogs hang unhealthy vapors, and among the rank reeds there is no fly, nor mosquito, nor living soul or sound in the autumn.

Not even infantry could pass over this region—not to consider cavalry or artillery, save in the depth of a cold winter when the water and mire is frozen. Even then it would be impossible to

venture over the ice with heavy guns. An invading army must, therefore, split in two parts and pass around the sides, and nothing is more dangerous than splitting an army in the face of the enemy. It is behind these vast marshes that we shall find the Russians planned to make their first determined stand.

Here, too, the Russians expected to have the advantage of being surrounded by their own people, for this is the country of the White Russians, so called on account of their costumes. Here the purest Slavic type is preserved; they have not blended with other stocks, as the Great Russians with the Finns and the Little Russians, farther south, with the Mongols. For a while this territory was subject to the kings of Poland, who oppressed its inhabitants most barbarously, from the effects of which they have not even fully recovered. To-day White Russia is one of the poorest and most backward parts of the empire. And even yet the great bulk of the landlords are Poles.

CHAPTER XLIII

AUSTRIAN POLAND, GALICIA AND BUKOWINA

LET us now pass ahead of the armies into the southern section of the eastern front. Here we have to consider only Austrian Poland, Galicia and Bukowina, for here there is much less swaying back and forth, the Russians maintaining their lines much more steadily than farther north. This section is an undulating terrace which slopes down to the Vistula and the Dniester; behind rise the Carpathian ranges, forming the natural frontier between the broad, fertile plains of Hungary and Russia. Here the population is quite dense, there being 240 inhabitants to the square mile. Nearly half of the total area is in farm lands, about one-fourth woodland, and the rest mostly meadow and pasture, less than a quarter of one per cent being lake or swamp. Rich crops of barley, oats, rye, wheat, and corn are grown here, while

the mineral resources include coal, salt, and petroleum, the latter especially being important in modern warfare on account of the great quantities of fuel necessary for motor carriages.

Here, in Galicia, we shall witness the conquests of the important city of Lemberg — with its 160,000 population — fourth in size of all Austrian cities, only Vienna, Prague, and Trieste being larger. Further in toward the mountains we shall see the storming of the strongly fortified city of Przemyśl (pronounced Peremisel), also important as the junction of the network of railroads that the Austrians had built throughout the country, including several lines passing over the Carpathians into Hungary. And farther west still we shall look upon the invasion of the old Polish city of Cracow, also strongly fortified. This section is especially rich in industries, mines, and agriculture.

Here, too, is staged many of the battles of the rivers—parallel with the mountain ranges flows the Dniester in a southeasterly direction, into which, flowing down from the north and running parallel with each other, empty the Gnila Lipa, the Złota Lipa, and the Strypa, all of which figure prominently in the war movements. For each of these is crossed several times by both armies engaged at bloody costs.

As will be noted by reading the chapters on the fighting on the eastern front, here, as in East Prussia, the Russians make a determined advance and actually succeed in conquering this territory from the Austrians. At one time we find them even in possession of all except one of the chief passes in the Carpathians and threatening to overrun the plains of Hungary. To hold Russian Poland, it was necessary that they should have a firm grip of East Prussia and Austrian Poland, thus protecting the flanks of their center. Had they been able to hold their grip, then they could have straightened out their entire line from north to south, and Warsaw would have been safe. But we shall see both their extremities driven back; therefore Warsaw was in danger, in spite of its fortifications.

That the Austrians should have allowed themselves to be thrust back over the Carpathians is one of the surprises of the early stages of the war. For these mountains are only second in

size in all Europe to the Alps themselves, forming the eastern wing of the great European mountain system. They are about 800 miles long and nearly 250 miles wide in parts. Some of the higher peaks reach 8,000 feet above sea level.

Imagine the vision of an army marching along the roads from the foothills to the mountains leading through mysterious, shadowy spruce forests, where the soil is covered with rich carpets of moss. Foaming streams ripple in among the moss-covered bowlders. Then the paths emerge on the cheerful, emerald-green pastures of the slopes, alive with the flocks of goats, sheep and cattle, attended by their shepherds. A little farther, and the whole scenery changes and the armies approach tremendous mountains of solid granite, ominously dark, shining like hammered iron, rise abruptly from the stone débris and black patches of mountain fir and towering bluffs and crags seem to pierce the sky with their sharp peaks, bastions and jagged ridges, like gigantic fortresses. Clouds of white mist, driven and torn by gusts of wind, cling to the precipitous walls and masses of eternal snow lie in the many fissures and depressions, forming large, sharply outlined streaks and patches.

This, indeed, is the natural frontier between the Slavs and the Hungarians; how effectively it has separated these two races from each other may be judged by the fact that the shepherds on the south side of the slopes are unable to converse with those on the north slopes when by chance they meet. Those on the south are Magyars. Those on the north are mostly Ruthenians, a branch of the Slavs closely akin to the little Russians. Further down in the foothills the Ruthenian communities intermingle with the Poles, but the latter have never taken kindly to a mountain life and are seldom found up on the slopes of the mountains themselves.

CHAPTER XLIV

THE BALKANS—COUNTRIES AND PEOPLES

THIS survey of the fighting ground in eastern Europe brings us now to the "cockpit of the war." From a military point of view, but not from the political, the Balkan theatre is the least important of the three big fronts in Europe. Here the armies engaged are numbered only by the hundred thousands, none reaches a million. But from the point of view of human interest and political intrigue it is by far the most picturesque. Here the hatred between the combatants is most bitter; indeed so bitter, that when it burst into flame it was intense enough to send a mad whirlwind of passion sweeping over half the world. For here the great conflagration began.

A map of the Balkan Peninsula is almost, on the face of it, a full explanation of the causes of the war. The military campaigns, studied in connection with their physical environment, explain all the diplomatic intrigues of the past fifty years, for they are the intrigues themselves translated into action.

Geographically speaking, the Balkan nations are those situated in the big peninsula of southern Europe which lies below the Danube River and the northern boarder of Montenegro. Some authorities, however, include Rumania, and others even bring in Austria's Slavic provinces, Bosina and Herzegovina.

The most noticeable feature of this vast war-ridden region is its mountains. Those same Carpathian Mountains, which form the natural boundary between the land of the Magyars and the Russian plains, take a sudden turn westward at the Rumanian frontier, then sweep around in a great semicircle, forming a shape resembling a scythe, the handle of which reaches up into Poland, the blade curling around within the Balkan Peninsula. Behind the handle, and above the upper part of the blade, stretch the broad plains of Hungary, through which flows the great Danube, the largest river in Europe, next to the Russian Volga—a river which flowed with blood during the Great

War. Just in the middle of the back of the blade, this great river bursts through the mountain chain, swirling through the famous Iron Gate, into the great basin within the curved blade. On the south of its farther course to the Black Sea lie the plains of northern Bulgaria.

The curving chain of mountains below the Iron Gate is the Balkan Range. But excepting for the plains of Thrace, lying south of the Balkans, over toward the Black Sea and above Constantinople, the rest of the peninsula is almost entirely one confused tangle of craggy mountains, interspersed throughout with small, fertile valleys and plateaus. This roughness of surface becomes especially aggravated as one passes westward, and over toward the Adriatic coast, from Greece up into the Austrian province of Dalmatia, the country is almost inaccessible to ordinary travelers.

What is the political value of this beleaguered domain? The broad, significant fact is that any road from western Europe to the Orient must pass through the Balkan Peninsula, and that these mountains almost block that road. From north to south there is just one highway, so narrow that it is really a defile.

This road stretches from the seat of the war at Belgrade on the Danube, down a narrow valley, the Morava, thence through the highlands of Macedonia into the Vardar Valley to Saloniki, on the Ægean Sea. At Nish, above Macedonia, another road branches off into Bulgaria across the plains of Thrace and into Constantinople. This was the road by which the Crusaders swarmed down to conquer the Holy Land. This was the road by which, hundreds of years later, the Moslems swarmed up into the plains of Hungary and overran the south of Europe, until they were finally checked outside the gates of Vienna. Nothing is more significant of the terror that these marching hosts inspired than the fact that, with the exception of a few larger towns, the villages hid themselves away from this highway in the hills.

Bear clearly in mind that in the existence of this narrow way to the Orient lies the key, not only to the causes of the war,

but to the military campaigns that we shall follow in this region. For it is the Teutons who would in the Great War, like the Crusaders of old, pass down this highway and again conquer the East, though in this case their object is trade, and not the Holy Sepulcher.

To secure the pathway through this strategic country it also is necessary to have control of the territory on all sides, and this is quite as true in a political as in a military sense. To secure their pathway up into Europe the Turks once conquered all the peoples in the Balkans, except those inhabiting the mountains over on the Adriatic; the Montenegrins and a small city called Ragusa, just above Montenegro in Dalmatia. It is not at all peculiar that just here, in almost the same locality, the Teutons should meet with the first and strongest resistance.

A study of the territory in which the first fighting of the war occurred will explain the foregoing calculations. It will be observed that Austrian territory runs down past the eastward turn in the Danube, along the frontier of Montenegro, until it narrows gradually into a tip at Cattaro, just below Cetinje, the Montenegrin capital. This land is composed of the three provinces of Bosnia, Herzegovina and Dalmatia. All this territory is inhabited by the same race that peoples Serbia and Montenegro—the Serbs. In fact, the Slavic population reaches up all along the coast to Trieste, and even a little beyond. For this reason it is in this direction that we shall see the Serbians and the Montenegrins invade Austrian territory, after their initial success in repulsing the Austrian invasion.

The objectives of the brief campaign soon to be considered were Sarajevo, the capital of Bosnia, and Ragusa, the famous little seaport on the Adriatic. Ragusa is of especial interest on account of its remarkable history. In the Middle Ages it was the most important seaport in that part of the world. Its ships sailed over all the Mediterranean and from them is derived the word "argosy," signifying a ship laden with wealth. Again and again the Turks attempted to conquer this little state, which was at that time a republic, but always the Ragusans beat off the enemy. For the country about is so rocky, so rough, that

the city was easily defended, especially in that time when nearly all fighting was hand to hand.

The first and foremost word in the Great War—the key word—is Sarajevo. Here is the scene of the assassination of the Crown Prince of Austria, which was at least the final cause of the war. As we enter it we find a population of about forty thousand, half of which are Mohammedans. It is a large, straggling town, situated in a narrowing valley overtopped by steep hills on either side, which close in a narrow gorge in the east and broaden into a plain on the west. It was to the eastward however, that we shall find the heavy fighting along the Austro-Serbian frontier.

The armies along the Danube will soon command our attention. As they follow the river toward Belgrade, the capital of Serbia, it is no longer the "Blue Danube" of the famous German song. Here, in fact, it is a broad, mud-colored river, dotted with a number of low islands along its center. Belgrade, where the first shots of the war were fired, is located on rather high ground, backed by a semicircle of low hills in its rear. But opposite, all is flat and, in places, marshy. Modern guns could, of course, keep up an effective fire across the river at this point, as in fact they did before the actual invasion of Serbia began, but the conditions for a crossing are not favorable. It was from the west, from the Bosnian side, that the actual attack was made.

Just below Belgrade the river Save, shallower and narrower, empties into the Danube, forming the frontier westward, past Shabatz, to Ratcha, where the Drina, flowing down from the Macedonian highlands northward, joins it, forming the western frontier between Bosnia and Serbia.

The Drina, where much fighting occurs, is no ordinary waterway, no mere mountain stream, though it lies in a mountainous country. Before reaching its junction with the Save it is fed by many important tributaries. Ever swift, often torrential, it has washed out a bed of imposing width, and by a constant cutting out of new courses has created a series of deltas. It was one of the largest of these islands, that of Kuriachista, between Losnitza and Leschnitza, that the Austrians chose as a base

for their first invasion. From this point up and around to Shabatatz lies the bloody field of the Austro-Serbian battles.

A description of this section, in brief at least, is necessary to an understanding of the three Austrian invasions made here, and all three of which failed disastrously. North and west of Shabatatz lies the great plain of Matchva, bounded on its east and north by the Save and by the Drina on the west. It is a rich, fertile land, but much broken up by woodland. To the southeast a rolling valley is divided by the River Dobrava, while due south the Tzer Mountains rise like a camel's back out of the plain and stretch right across from the Drina to the Dobrava. The southern slopes of Tzer are less abrupt than those on the north and descend gradually into the Leschnitza Valley, out of which rises the lesser heights of the Iverak Mountains. Both these ranges are largely covered by prune orchards, intersected with some sparse timber.

This is a region of natural fortifications. Descending southward again, the foothills of Iverak are lost in a chain of summits, which flank the right bank of the Jadar River, that tributary of the Drina River from which the first big battle takes its name.

From the left bank of the Jadar, from its junction with the Drina to Jarebitze, a great rolling level stretches south until the high Guchevo Mountains, stretching in southeasterly direction, rise abruptly and hide the Bosnian hills from view. From there, southward, the country is extremely mountainous, even the highways being blasted out of the sides of the precipitous mountainsides along the innumerable ravines through which run watercourses which, though almost dry in summer, burst into torrential streams after the snows begin to melt in the higher altitudes.

Naturally, in such a country roads are of prime importance in military operations. A few built and maintained by the state are in excellent condition and practicable in all sorts of weather. But for the rest communications consist of bridle paths and trails over the mountains.

As has been stated, the great highway from Belgrade to Saloniki is the key to all military operations in the Balkans; nor is this case any exception. A study of the map will show how

this big, underlying fact entered into the plans of the first three attempts at invading Serbia. Naturally, had facilities been convenient at Belgrade, that would have been the point from which to advance. The next possible point was over the Drina, because it was not so wide or so deep.

Bosnia and Herzegovina at the beginning of the war were sparsely served by railroads. But for the purpose of an invasion of Serbia the lines running to Tuzla in the north and to Vishegrad and Uvatz in the south were of much strategic importance. Moreover, unlike the Hungarian plain opposite Belgrade, the country is so mountainous and well wooded that great bodies of troops could be moved about without being observed. We now come to the main reason why this point was chosen, next to Belgrade. Though we shall see that they did not reach it at their first attempt, there is no doubt that the main objective of the Austrians was the little town of Valievo, lying some distance back from the Jadar and the field of battle. For at Valievo is the terminus of a light railway which joins with the main line running from Belgrade down to Saloniki. The Teutons were in a hurry to open this highway, for it meant opening a means of communication with the Turks, who were to become, and later did become, their active allies. These are political matters of significance here inasmuch as they explain the special importance of the railway from Belgrade south along the ancient highway of the Crusaders.

Before following this route farther south, a few words should be devoted to Montenegro. Between Serbia and Montenegro lies the Sanjak of Novibazar. This small territory nominally belonged to Turkey before the Balkan War, but it was in fact garrisoned by Austrian troops, the civil administration being left to the Turks. Austria had gone to special trouble to establish this arrangement, so that it might have a wedge in between the territories of the two little Serb nations. Anticipating this war long ago, Austria had counted on having a large enough force in Novibazar to prevent a union of the two armies. But, when it actually came, she was in no position to prevent it, so much of her strength being required to meet the Russians.

Montenegro is the natural refuge of the Serbs. Whenever in the past they were especially hard pressed by the Turks, they would flee to the mountain fastnesses of Tcherná Gora, the Black Mountain, for here military operations, even in this day of modern artillery, are absolutely impossible, and when it came to mountain guerilla fighting, the Turks were no match for the Serbs. Thus it was that the Serbs were able to preserve their old traditions, their language and the best blood of their race. And to a slightly lesser extent, it may be said that Ragusa served the same purpose.

The Montenegrins are born fighters and die fighters. From one end to the other Montenegro is one wilderness of mountain crags and towering precipices, traversed only by foot trails. Here and there a shelf of level soil may be found, just enough to enable people to grow their own necessities. The capital of this rocky domain, high up among the crags and overlooking the Adriatic, is Cetinje, which was to be stormed and conquered by the Teutons. The main street, about 150 yards long, comprises two-thirds of the town, so broad that three or four carriages may be driven abreast down the length of it. It is composed entirely of one-and two-story cottages. A few short streets branch off at right angles, and in these is all of Cetinje that is not comprised in the main street. The king inhabited a modest looking, brown edifice with a small garden attached. Overlooking the capital is Mt. Lovcen, on top of which the Montenegrins planted guns to defend any attack that might be made against them.

South of Montenegro, and north of Greece lies another country of instinctive fighters. It is similar in physical aspect, but very different in its population. This is the land of the Albanians, whom the Turks conquered, not by force of arms, but through their religion. They are a very distinct race by themselves; it is supposed that they are the descendants of the ancient Illyrians, those wild tribes of whom the ancient Greeks wrote. Nor is this unlikely, for in such a country as theirs the inhabitants are most likely to remain pure from generation to generation.

Returning for a few moments to Belgrade, we now may resume

our course down the ancient highway toward Saloniki. Down the Morava Valley passes the railroad, after which it passes within a few miles of the Bulgarian frontier, near Kustendil; dangerously near the frontier of a possible enemy, but especially perilous in this war in which the Serbians would naturally endeavor to retreat toward her ally, Greece.

Just below Vrania the railroad enters what was, before the two Balkans Wars, the Turkish territory of Macedonia, not so marked on any map, but so known from ancient times. However, this region became Serbian territory down to within sixty miles of Saloniki. Throughout this region there are so many mountain ranges that it would be impossible to name them all. Nowhere has blood been more continuously shed than here, and nowhere in Europe is the scenery more beautiful.

Especially impressive is that section around Monastir, toward the frontier of Albania and away from the main line of the railroad. Here, not more than a day's walk from the city of Monastir, or Bitolia, as its Slavic inhabitants call it, is Lake Prespa, a small sheet of crystal-clear water in which is reflected the peaks and the rugged crags of the surrounding mountains. Through a subterranean passage the waters of this mountain lake pass under the range that separates it from the much larger lake, Ochrida, the source of the bloody Drina.

Although Serbian territory, this region has been a heavy weight on the shoulders of Serbia during her troubles. For it was her taking possession of it that brought her the bitter enmity of the Bulgars; not only the Bulgars of Bulgaria, but the Bulgars of Macedonia. The people of these mountains are not Serbs. From below Uskub, over to the borders of Albania and down almost to Saloniki, then over to the plains of Thrace, the population is Bulgarian.

For the past generation these Macedonian Bulgars have been trained to all the ways of guerilla fighting. Roaming through their mountains in small bands and supported by the peasantry, they have harassed the Turkish soldiers continuously. Their first hope was for an autonomous Macedonia under Turkish rule, but when that failed them they wished to become a part of

Bulgaria. The fortunes of war went against them in the Second Balkan War, and they passed under Serbian rule. Nor can there be any doubt that the Serbian Government treated them very harshly; quite as harshly as the Turks had treated the Serbians. They even went a step further, for they attempted to extinguish their national spirit.

When hostilities broke out in 1914, when Serbia was defending herself against the Austrians, the Macedonian guerillas, the "Comitajis," as they were called, went into the mountains again and began harassing Serbia as they had once harassed the Turks.

Shortly below the city of Monastir in the west begins the Greek frontier, running over eastward to Doiran, where it touches the Bulgarian frontier. Here the railroad, coming down along the Vardar River, emerges into the swamp lands and over them passes into the city of Saloniki.

Here is the old territory of Philip of Macedon, the father of the conqueror. For some forty or fifty miles these swamps stretch out from Saloniki, overshadowed by Mt. Olympus on their southern edge. While not quite so extensive as the Pinsk Swamps, they are quite as impassable, from a military point of view. In the center of this region of bullrushes and stunted forest is an open sheet of shallow water, Lake Enedjee.

Nearly all this swamp land is submerged, but here and there are small islands. For some years the Turkish soldiers garrisoned these islands during the mild winter months, living on them in rush huts. In the summer they would withdraw into the near-by foothills. But one summer several hundred Comitajis descended into the swamps, guided by the fishermen who lived about the shores, and took possession.

The stunted forests and the bullrushes here are traversed by a maize of narrow waterways, just wide enough for a punt to pass along. When the soldiers returned in the fall, they started out for their islands in strings of punts. Presently they were met by volleys of bullets that seemed to come from all directions out of the bullrushes. Some, in their panic, leaped out into the shallow water and sunk in the mire. The rest retired.

For years the Turkish soldiers attempted to drive the Bulgar

Comitajis out of the swamp. First they surrounded it, watching all possible landing places, but the outlaws had supplies smuggled into them by the peasants. Then the Turks began bombarding with heavy cannon, which, of course, was futile, since they could not distinguish the points at which they were firing. And finally they gave up molesting the Comitajis, who continued making the swamps their headquarters until the Young Turks came into power. Then, believing that a constitutional Macedonia was finally to be granted them, all the Comitajis laid down their arms.

It is a peculiar fact that Saloniki, one of the largest cities on the peninsula, with a population considerably over a hundred thousand, should represent none of the national elements of the country. For though Bulgars, Turks, Greeks, and Serbs may be found there, an overwhelming majority, nearly 90,000 of the people, are Spanish Jews.

Walking along the streets, it would be easy to imagine oneself in Spain or in Mexico; on all sides the shouts of peddlers, the cries of cabmen, the conversation of pedestrians, are in Spanish. With a knowledge of that language the stranger may make his way about as easily as in his own native country. These are the descendants of the Jews who were driven out of Spain by Torquemada and his Spanish Inquisition and were so hospitably received by the Sultan of Turkey.

Saloniki, where we shall witness severe battles, is situated at the head of the gulf by the same name, an inlet of the Ægean Sea. It is a well-fortified city, built on the water's edge, but surrounding it is high land commanding the surrounding country. Added to that, the swamp region is another protection from an enemy coming from inland. Its seaward forts, however, are, or were, obsolete and would probably crumble before the fire of modern naval guns.

Stretching down the eastern shore of the Gulf is a peninsula on which is the famous Mt. Athos, that very peculiar community of celibate monks. Here, in the Holy Forest, as the Slavs call it, there are monasteries representing all the various denominations of the Greek Orthodox Church: Greek, Bulgarian, Serbian, and

Russian, each swarming with hundreds of monks, who pass their time in idleness. Not only are women forbidden to enter this domain, but even female dogs or cats are kept out.

Across this upper end of the Ægean, from Mt. Athos, is the Bulgarian port, Dedeagatch, to which runs a branch of the main railway from Sofia to Constantinople. The country here is low and swampy, the port itself being little more than a boat landing.

Just below this point, across the Gulf of Saros, is the peninsula of Gallipoli, where a critical phase of the war was fought. It is somewhat like the blade of a scimitar, covering the entrance to the Sea of Marmora. Between this strip of land and the coast of Asia Minor is a narrow strait, the outer mouth of which is called the Dardanelles, the inner gateway being the famous Hellespont. Here it was that Xerxes crossed over on a bridge of boats at the head of his Persian army to invade Greece, only to meet disaster at Thermopylæ, and here Alexander of Macedonia crossed over to begin his march of conquest which was to extend his power as far as India. And about this narrow strait is centered the ancient Greek myth about Hero and Leander, which inspired Byron to swim across from Asia to Europe.

How well the Turks have fortified this approach to their capital is well enough indicated in the story of the operations of the allied fleets in their attempt to force the passage.

From the Hellespont to Constantinople is a sail of forty miles, along a coast steep and rugged, destitute of any harbor or even a beach where a boat might land. Nor is there a more beautiful sight than that which is presented on approaching the Turkish capital from this direction, especially of an early morning. Against the dawn in the East are silhouetted the minarets and domes and the palace roofs of the city; then, as the light increases, the white buildings are distinguished more clearly through a purple mist that rises from the waters, until the ship enters the Bosphorus, gliding past the shipping and the boat traffic along the shore of the harbor. The beauties of the Bosphorus have been described in every book of travel that has ever included this section of the world in its descriptions: it is un-

doubtedly the most beautiful waterway that may be found in any country.

Emerging into the Black Sea from the Bosphorus, one strikes the Bulgarian coast not far above that neck of land on which Constantinople is built. Along this stretch of coast up to the mouth of the Danube there are two harbors, Varna and Burgas. Each is terminus of a branch railroad leading off from the Nish-Sofia-Constantinople line. Behind Burgas lie the level tracts of Eastern Rumelia, or Thrace, as that part of the country is still called. But Varna is above the point where the Balkan Range strikes the coast, all of which is steep and rocky.

Above Varna begins the Delta of the Danube, up which steamers and heavily laden barges sail continuously, but here also begins the neutral territory of Rumania, the Dobruja, the richest section of the Danube basin, which was ceded to Rumania by Bulgaria after the Second Balkan War.

CHAPTER XLV

THE CAUCASUS—THE BARRED DOOR

WE come now to that section of the eastern theatre of the war which received the least extended notice in printed reports—the barred doorway between Europe and Asia—the Caucasus. Not because the fighting there was less furious, but because the region was less accessible to war correspondents. The struggle was in fact quite as bloody and even more savage and barbarous here than elsewhere, for on this front Russ meets Turk, Christian meets Moslem, and where they grapple the veneer of chivalry blisters off.

Here again, as in Galicia, we come to a natural frontier, not only between two races, but between two continents. For here, crossing the isthmus between the Black Sea and the Caspian, stretches a mountain range over seven hundred miles in length, rising abruptly out of the plains on either side. These are the

Caucasus Mountains, forming the boundary between Europe and Asia.

The higher and central part of the range (which averages only from sixty to seventy miles in width) is formed of parallel ridges, not separated by deep and wide valleys, but remarkably connected by elevated plateaus, which are traversed by narrow fissures of extreme depth. The highest peaks are in the most central chain; Mt. Elburz, attaining an elevation of 18,000 feet above the sea, while Mt. Kasbeck reaches a height of more than 16,000 feet, and several other peaks rise above the line of perpetual snow. The outlying spurs and foothills of this chain of lofty mountains are of less extent and importance than those of almost any other mountain range of similar magnitude, subsiding, as they do, until they are only 200 feet high along the shores of the Black Sea. Some parts are almost entirely bare, but other parts are densely wooded and the secondary ranges near the Black Sea are covered by magnificent forests of oak, beech, ash, maple, and walnut.

This range is an almost impassable wall across the narrow isthmus which joins Europe and Asia, and the Gorge of Dariel is the gateway in this wall through which have come almost all the migrating races that have peopled the continent of Europe. As is well known, the white peoples of Europe have been classified as the Caucasian race, because they were all supposed to have passed through this gateway originally. Apparently each of these oncoming waves of barbaric humanity, bursting through the great gateway, must have left behind some few remnants of their volume, for nowhere in the world, in so limited an area, is there such a diversity and mixture of peoples. In the words of one writer, who speaks with authority on this region, the Caucasus is "an ethnological museum where the invaders of Europe, as they traveled westward to be manufactured into nations, left behind samples of themselves in their raw condition."

Here may be found the Georgians, who so long championed the Cross against the Crescent, the wild Lesghians from the highlands of Daghestan; the Circassians, famed for the beauty of their women; Suanetians, Ossets, Abkhasians, Mingrelians, not

to enumerate dozens of other tribes and races, each speaking its own tongue. It is said that over a hundred languages are spoken throughout this region; seventy in the city of Tiflis alone.

The scenery of the mountains themselves is unparalleled in grandeur except by the Himalayas and offers many a virgin peak to the ambitious mountain climber. Here may be found the ibex, the stag, the wild boar, the wild bull and an infinite variety of feathered game. The animal life of the mountains has, in fact, become more abundant of late years on account of the high charges for hunting licenses fixed by the Russian Government. Wolves are so plentiful that in severe winters they descend to the lowlands in great packs and rob the flocks before the very eyes of the shepherds.

The most important mineral resources of the region are the oil wells; here, in fact, around Batum, are situated some of the most important oil fields in the world. Of manganese ore, an essential of the steel industry, the Caucasus furnishes half of the world's supply, which is exported from the two ports Poti and Batum. Its mineral wealth seems to be practically unlimited, copper, zinc, iron, tin, and many other metals being found throughout the region in most cases in exceedingly rich deposits. The agricultural resources are not so important, especially from a military point of view, though vast quantities of sheep are raised in the highlands in the spring and summer, the flocks being driven down into the plains to the south in winter.

One of the outstanding features of Russian occupation is the great Georgian military road which has been built across the mountains of recent years and maintained by the Government. Its engineering is masterly; here and there it passes close to or under vast overhanging lumps of mountainside. Everywhere the greatest care has been taken of this most important military highway, Russia's avenue into that country she coveted and fought for so long. Beginning at Vladikavkaz, it runs through Balta, Lars, thence through the famous Gorge of Dariel, the "Circassian Gates," the dark and awful defile between Europe and Asia. The gorge is what the geologists call a "fault," for it is not really a pass over the mountain chain, but a rent clear across

it. Seventy years ago it was almost impassable for avalanches or the sudden outbursts of pent-up glacial streams swept it from end to end, but the Russians have spent over \$20,000,000 on it and made it safe. In 1877, during the Russo-Turkish War, nearly all the troops and stores for carrying the war into Turkey and Asia came by this road.

Its importance has since been lessened to a certain degree, for there is now direct railway communication from Moscow to Baku, at one end of the Trans-Caucasian Railway, and therefore to Kars itself, via Tiflis; and equally from Batum to Kars at the other end to which military steamers can bring troops and supplies from Odessa and Novorossik in the Black Sea.

The most important city in this region is Tiflis, the "city of seventy languages." It may, indeed, be called the modern Babel. As seen from the mountains, it lies at the bottom of a brown, treeless valley, between steep hills, on either side of the River Kura.

It is a point of great importance to modern Russia. It forms, to begin with, the end of the great military road across the mountains which, in spite of the railways, is still the quickest way to Europe for an army as well as for travelers, and all the mails come over it by express coaches. From Tiflis a railway runs to Kars, a strong frontier on the Persian frontier.

Tiflis has been much developed under the Russian Government. In the modern section of the city the streets are wide and paved and lighted by electricity and the stores are large and handsome while electric railways run in all directions. In the older parts of the city, however, the houses remain as they were built centuries ago, divided out into the many quarters devoted to the residences of the many races and nationalities that compose the population of Tiflis. Between most of them is bitter enmity and prejudice, even among those of the two great religious faiths, Christians and Mohammedans. It is this diversity of interests, which extends throughout all the section down into Persia, which has so complicated the situation on this front. For not only are the two military forces fighting here, but wherever governmental authority is momentarily relaxed, there these mutual animosities

flare up into active expression and the most barbarous features of warfare take place, such as the massacres of the Armenians by the Mohammedans. Neither Turkey nor Russia has been especially eager to suppress these bitter feuds, even in time of peace. In time of war there is nothing to restrain them, and the whole region is swept by carnage infinitely more hideous than legitimate warfare.

We have now passed over the entire theatre of the battles on the Eastern frontiers of the war in Europe. The battle grounds are familiar to us. In the succeeding chapters we will follow the armies over this war-ridden dominion and watch the battle lines as they move through the war to its decisive conclusion.

PART IV—THE AUSTRO-SERBIAN CAMPAIGN

CHAPTER XLVI

SERBIA'S SITUATION AND RESOURCES

THE first great campaign on the southeastern battle grounds of the Great War began on July 27, 1914, when the Austrian troops undertook their first invasion of Serbia. They crossed the Serbian border at Mitrovitz, about fifty miles northwest of Belgrade, driving the Serbians before them. The first real hostilities of the war opened with the bombardment of Belgrade by the Austrians on July 29, 1914—six days before the beginning of the campaigns on the western battle fields.

We are now familiar with the theatre of war as described in the preceding chapters, and will now follow the first Austrian armies into Serbia.

A stubborn fight excites the admiration of all observers, regardless of the moral qualities of the combatants. So, wherever, our sympathies may lie, considering the war as a whole, there can be no doubt that the defense which the Serbians made against the first efforts of the Austrians to invade their country will stand out in the early history of the war as one of the most brilliant episodes of that period of the general struggle. Like a mighty tidal wave from the ocean the Austrian hosts swept over the Serbian frontier in three furious successive onslaughts, only to be beaten back each time. Naturally, there were material and moral causes, aside from the mere valor of the Serbians, which combined to create this disaster for the Austrian forces, but enough of the human element enters into the military

activities of these campaigns to make them easily the most picturesque of the early period of the war.

Before entering into a description of the actual events in 1914, it is well to consider the forces engaged. From a material point of view the Serbians entered into these campaigns greatly handicapped. They had lately been through two wars. In the First Balkan War they had not, it is true, been severely tested; the weight of the fighting had been borne by the Bulgarians in Thrace. The real test, and the great losses, came only with the second war, when the Serbian Army threw every fiber of its strength against the Bulgarians in the Battle of the Bregalnitz, one of the most stubborn struggles in military history. The result was a Serbian victory, but it was very far from being a decisive and conclusive victory. The Bulgarians were forced back some fifteen miles into their own territory, but had it not been for the intervention of Rumania there can be no doubt that they would have come on again. Here it was that the Serbians lost 7,000 killed and 30,000 wounded of their best men, as against 5,000 killed and 18,000 wounded in the whole war with Turkey; a total loss that was bound to be felt a few months later when the struggle was to be against so powerful an adversary as Austria-Hungary. The two previous wars had, without exaggeration, deprived the Serbian fighting forces of one-tenth their number—a tenth that was of the very best of first-line troops.

Added to this was another serious handicap, possibly even more serious. Serbia had, indeed, emerged victorious from the two wars, with a large stretch of conquered territory at her backdoor. But this acquired territory, practically all of Macedonia that had not gone to Greece, was peopled not by Serbs but by Bulgars. For over a decade these Macedonian Bulgars had been organized into an effective revolutionary fighting organization, the "Macedonian Committee," and had struggled, not only against the Turks, but against armed bands of Serbian and Greek propagandists. During the First Balkan War these experienced guerrilla fighters had been valuable allies to the Serbian forces operating against the Turks, for they had counted on becoming part of the Bulgarian nation.

PICTORIAL MAP OF THE BALKANS

But even before the First Balkan War, immediately after the first victory at Kumanova, the Serbians had very distinctly given the Macedonians to understand that they were to remain Serbian subjects. This action on their part had had not a little to do with rousing the Bulgarians to precipitate the Second Balkan War. And when finally Serbia did acquire all this territory down to Doiran, through the Treaty of Bucharest, she began at once such a fiery propaganda of "nationalization" that the whole population was bitterly incensed. The Turks at least had allowed these people to call themselves Bulgars; the Serbians would not even allow that. In some respects conditions were much worse than they had been under Turkey.

When the Great War broke out in July, 1914, these Macedonians naturally did not intend to shed their blood for those whom they still considered their oppressors. On the contrary, they thought they saw here their opportunity to attain that freedom which they had fought for so many years. Thus it was that when the Austrians attacked the Serbians on their front the Serbians had still to detach enough of their forces to guard themselves from attacks in their rear, for now the Macedonian "Comitajis" become extremely active. And added to this was the danger from Bulgaria herself. With the loss of her Macedonian kinsfolk still rankling within her, the Serbians knew that the opportune moment had only to come and she, too, would hurl herself on the Serbian eastern flank. Thus another large percentage of the Serbian fighting forces had also to be stationed along the Bulgarian frontier to guard against possible attack from that quarter.

Offsetting these handicaps, however, and more than equalizing them, was the moral strength of the Serbian fighting units. They had just emerged through two victorious wars; they had triumphed so completely that there was small wonder if the Serbian peasants had come to believe themselves invincible and their leaders infallible. Practically every man in the Serbian army was a seasoned veteran; he had had not only his baptism of fire, but he had been through some of the bloodiest battles of modern times. He had got over his first fright; he was in

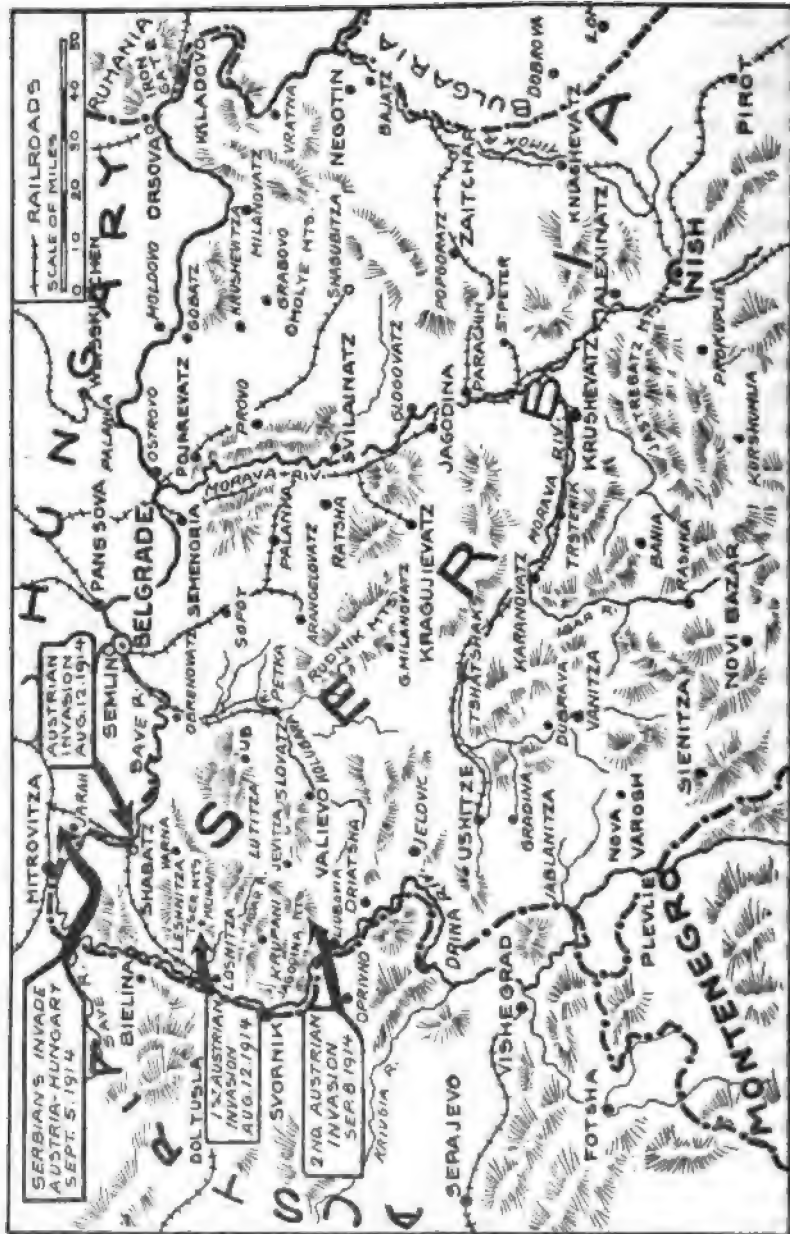

that state of mind where danger and bloodshed no longer inspired either fear or horror. And even the warlike savage trembles on entering his first battle. Finally, he was now defending his country, his home, his very fireside and his family against foreign invasion. And it is generally admitted that a man fighting in that situation is equal to two invaders, all other things being equal.

It may be said, therefore, that all those in the fighting forces which opposed the Austrian invasions were natives of Old Serbia—that portion of Serbian territory constituting the kingdom before the two Balkan wars.

The principles on which the organization of the Serbian army was based were very simple. The former kingdom was divided into five territorial divisional districts—Nish, Valievo, Belgrade, Kragujevatz, and Zaitchar. Each of these territorial divisions was subdivided into two brigade districts, and each district provided two regiments of four battalions each. The battalion numbered about a thousand men, so that the war strength of the divisional infantry amounted to about 16,000 men. Attached to each division was a regiment of artillery, consisting of three groups of three 6-gun batteries; in all, 54 guns. The divisional cavalry, existing only in war time, consisted of a regiment of four squadrons, from men and horses previously registered. To each division was also attached its own technical and administrative units, engineers and supply column, and its total strength amounted to 23,000 officers and men of first-line troops.

In addition to these five divisions of the First Ban, there was also a regiment of mountain artillery, made up of six batteries, six howitzer batteries and two battalions of fortress artillery. Then there was a separate cavalry division composed of two brigades, each of two regiments. Its war strength was 80 officers and 3,200 men. Attached to the cavalry division were two horse artillery batteries, of eight guns each. All told, this first-line army numbered about 125,000, with about 5,200 sabers and 330 guns.

The Second Ban, or reserve, much inferior in armament to the first-line, brought the strength up to about 180,000 men.

SERBIAN AND AUSTRIAN INVASIONS

But this figure is probably an underestimate. Volunteers were enrolled in immense numbers. Some of them were men who had been exempted in the first conscription; others were Serbs from Austrian territory. The United States sent back thousands of those who had emigrated there. It is probable, therefore, that the total strength of the Serbian forces shortly after the war broke out was at least 200,000, if not a trifle more. To this must be added the Montenegrin army which, though operating in a separate field, contributed its share in driving the Austrians back; another 40,000 men of first-class fighting ability and experience.

Finally, there was the third reserve, another 50,000 men, but they could be used for fighting only in the gravest emergency.

The infantry of the First Ban was armed with excellent Mannlicher and Mauser rifles. The Second Ban carried an inferior Mauser, an old rifle to which a magazine was clumsily fitted in the Serbian arsenals; while the Third Ban had the old single-loader Berdan rifle. The machine gun carried was the Maxim, of the same caliber as the new Mauser.

In artillery the Serbians were perhaps not so well off. Their cannons had seen a great deal of service in the Balkan wars, and the larger a piece of artillery the more limited is the number of rounds it can fire. It is extremely doubtful that there had been time to replace many of these worn-out pieces.

The field gun was of French make; it was a quick firer with a maximum range for shrapnel of 6,000 yards, a little over a mile. The Second Ban was armed with old De Bange guns of 8 cm. The heavy guns, which had done much service outside Adrianople, were of Creuzot make, and included 24 howitzers of 15 cm. and some mortars of 24 cm. As for the aviation wing, there was none.

The strategy of the Serbian army was under the direction of the Chief of the General Staff, Voivode (Field Marshal) Putnik. Unlike his younger colleagues, his military education was entirely a home product; he had never studied abroad. His father was one of those Serbs born on Austrian soil; he had emigrated from Hungary to Serbia in the early forties where he had fol-

lowed the vocation of school-teacher. In 1847 the future general was born. After passing through the elementary schools, young Putnik entered the military academy at Belgrade. He had already attained a commission when the war of 1876 with Turkey broke out, through which he served as a captain of infantry. His next experience was in the unfortunate war with Bulgaria, in 1885, in which the Serbians were beaten after only a three days' battle. At the outbreak of the war with Turkey, in 1912, General Putnik was made head of the army and received the grade of Voivode (literally war leader), being the first Serbian to enjoy that distinction. This position he held throughout both Balkan wars.

With him worked Colonel Pavlovitch, the son of a peasant, who had won a series of scholarships, enabling him to study in Berlin. He had directed the military operations in the field against Turkey and Bulgaria, and he was to do the same thing under his old chief against the Austrians.

CHAPTER XLVII

AUSTRIA'S STRENGTH AND STRATEGY

LET us now review the Austrian forces that participated in the invasions of Serbia. In number they were practically unlimited; at least they far outnumbered the Serbian forces that met them in the field. Their armament was of the best and their equipment as complete as boundless resources could make it. They were, however, partly made up of the peoples of the Slavic provinces of Austria—Bohemians, Croatians, Dalmatians and Bosnians. Naturally there could be but little enthusiasm in their attacks on their brother Slavs, and while there are many mutual animosities between these various branches of the Slavic race, such feelings are, at any rate, secondary to the general dislike of the "Schwabs," as the German-Austrians are called and the Magyars. Possibly this had much to do with the Aus-

trian defeats. The Hungarian, or Magyar, regiments were probably in the majority. But the Magyars from the interior of Hungary have no special reason to hate the Serbians, and, aside from that, they were attacking on foreign soil.

At the head of the Austrian campaigns against Serbia was General Potiorek, generally described as a textbook strategist. But just how much his failures were due to his own inefficiency and how much to the inefficiency of those under him will probably never be determined; he had in the end to suffer for both.

These were the two great contending forces that were set in motion by the departure of Baron Giesl, the Austro-Hungarian Minister, from Belgrade, on July 25, 1914. On the same day the Prince Regent Alexander signed a decree ordering the general mobilization of the Serbian army. Three days later, on July 28, 1914, Austria declared war. By that time Serbia was in the midst of her mobilization.

That the Austrians, who had the advantage of having taken the initiative, and who had presumably chosen their own time for the opening of hostilities, did not immediately take full advantage of their favorable situation has caused much surprise among impartial military critics. On the same day that they declared war they had the opportunity to hurl their troops across the Danube and take Belgrade with practically no opposition. Apparently they were not ready; from that moment the difficulties that would have attended such a movement increased hourly.

A force of 20,000 men was raised almost immediately for the defense of Belgrade. To meet this opposition the Austrians had, on the evening of the day war was declared, July 18, 1914, only one division concentrated between Semlin and Pancsova, opposite Belgrade—a force that was hardly sufficient to take the Serbian capital. Two days later an army corps would have been needed for the enterprise, for by this time the Serbian army had begun concentrating considerable numbers within striking distance of the capital. Thus the first opportunity was lost by the tardiness of the Austrians to act.

It is presumed that the reader has already studied the de-

scription of this theatre of the war presented elsewhere in this work. Aside from that, the movements that follow should only be traced with the aid of a map. Written words are inadequate to give a concrete picture of the field of operations.

The Austrian General Staff realized the difficulties of crossing the Danube. Its general plan, probably prepared long before, contemplated a main attack that should begin from another quarter.

The Austro-Serbian frontier, almost 340 miles in extent, is formed on the north by the Save as well as by the Danube, and on the east and southeast by the Drina River. These two smaller streams abound in convenient fords, especially in summer. To many of these points on the northeastern frontier Austria had already constructed strategic railways. Moreover, the Austrian territory throughout this section is so mountainous and well timbered that large forces of troops could be well screened from observation, whereas the country opposite Belgrade is flat and bare.

It was from this direction that the Serbian General Staff expected the first advance of the enemy. And yet, there were dozens of other points where an attack in force was possible. Each must be covered with a force at least strong enough to hold the enemy back long enough to enable the forces stationed at the other points to come up to support. Here was the great advantage that the Austrians had to begin with; an advantage which the attacking army always enjoys. The attacking general alone knows where the first battle shall be fought.

The Serbians, therefore, could not count on meeting the Austrians in full force before they could enter Serbian territory. They realized that they must give way at the first contact; that the Austrians would undoubtedly advance quite some distance within Serbian territory before enough Serbian forces could be brought up against them to make the opposition effective.

Realizing this, it was decided to place fairly strong advance guards at all probable points of invasion with orders to resist as long as possible; until, in fact, defensive tactics could be

adapted to the situation and the main Serbian army could be brought up to offer battle.

However, two points stood out as the most probable. These were the two already mentioned; the north, along the line from Obrenovatz to Belgrade and to Semendria; or, the front Obrenovatz-Ratza-Losnitza-Liubovia. The first possibility had the advantage to the Austrians of offering the shortest route to the center of the country—the Morava Valley, their natural objective. But it also necessitated a difficult crossing of the Danube, which would have had to be preceded by the building of pontoon bridges. This would have given the Serbians time to move up their main forces. The second alternative, an invasion from the east, would have entailed a longer journey, but the advantage of natural covering and easy crossing made it a sounder plan.

On July 28, 1914, the Serbians concentrated their forces in anticipation of either event. The outpost forces were stationed at or near Losnitza, Shabatz, Obrenovatz, Belgrade, Semendria, Pozarevatz and Gradishte. But their principal armies were centrally grouped along the line Palanka-Arangelovatz-Lazarevatz, while weaker, though important, detachments were stationed in the vicinity of Valievo, a branch railroad terminus, and Uzitze. This narrowed the field down to such limits that it was possible to march the troops from point to point, while the few railway facilities available were utilized for food and ammunition supplies.

CHAPTER XLVIII

AUSTRIAN SUCCESSES

ON the morning of July 29, 1914, the day after war had been declared, the residents of Belgrade were startled by a deep roar, followed by the whistling shriek of a huge body hurtling through the air, and a shell burst over the battlements of the old Turkish citadel, doing no damage. Immediately there came another deep shock; the Serbian guns were responding. Thence on

the cannonading along the Danube front continued for week after week, with only now and then a lull.

The Austrian batteries bombarded not only Belgrade, but Semendria, Gradishte and a number of other points along the river bank. Next they were seen building a pontoon bridge out to one of the little islands in the river, opposite the city and barges were towed alongside the landings on the opposite shore, presently to be crowded with black masses of Austrian troops. Naturally, the Serbian gunners made these objects the targets of their fire. But these were mere bluffs, such feints as the skilled boxer makes when he wants to get behind the guard of his opponent. If anything, these demonstrations only served to deepen the conviction of General Putnik that the real danger was not from this quarter.

But where was the first great blow to strike? Naturally, not only the General Staff, but the whole army and population waited in deep anxiety. This tension lasted over the last days of July, into the first week of August, 1914.

Then, on August 6, 1914, some Bosnian peasants, Serbs, appeared and reported that they had seen great bodies of soldiers moving along the mountain roads toward Syrmia, in north-eastern Bosnia. Two days later, early in the morning, two Austrian aeroplanes whirled over the River Save and circled over Krupani, Shabatz and Valievo. The last doubts were then dispelled; the attack was coming from the east.

And finally, on August 12, 1914, the message flashed over the wires that the outposts had seen boats in movement, full of soldiers, behind an island on the Drina, opposite Loznitz. Near that town, and in fact along the whole lower course of the Drina, the river has frequently changed its channel, thus cutting out numerous small islands, which would serve as a screen to the movements of troops contemplating a crossing. Pontoon bridges could be built on the further side of almost any of these islands without being observed from the other shore. This was exactly what the Austrians were doing.

Suddenly, on August 12, 1914, there came a burst of rifle fire and the boom of heavy field guns, and a fleet of barges, under cover

of this fire, emerged from around both ends of one of these islands and made for the Serbian shore. The two battalions of Third Reserve Serbians, stationed there as an outpost, trained their old De Bange field guns, of which they had two batteries, on the oncoming swarms and began firing. But the Austrian fire became heavier and heavier; a blast of steel pellets and shells swept through the cornfields and the plum orchards, tearing through the streets of the village and crumpling up the houses. The breastworks of the small Serbian detachment were literally the center of a continuous explosion of shells.

When a fell tenth of their number lay dead or disabled, the Serbians began retiring, across the cornfields and up the slopes leading to the heights behind Losmitza. There, on higher ground, which offered more effective shelter, they made a determined stand and continued their fire on the Austrian masses.

Having crossed the river, the Austrians threw up defensive breastworks and dug elaborate trenches, thus fortifying their crossing. Next they built a pontoon bridge, and then the main Austrian army poured across; a whole army corps and two divisions of a second.

Meanwhile, on the same day, August 12, 1914, a similar event was happening at Shabatz, on the Save, where that river takes a sharp southward turn and then swings up again before joining the Danube at Belgrade. Here the country is a level plain, really the southern limit of the great plain which stretches up to the Danube, past Belgrade and so into Hungary. Here, too, the Austrians screened themselves behind an island in the river, then hurled their forces across, driving the feeble detachment of Third Reserve Serbian troops back across the plain up into the hills lying to the southeast of Shabatz. Then the advance guard of the Austrian Fourth Army occupied the town, strongly fortified it and built a pontoon bridge across the river from their railroad terminus at Klenak.

Further passages of a similar nature were forced that day, August 12, 1914, at other points by smaller forces; one at Zvornik and another at Liubovia. In addition the Austrians also threw bridges across the river at Amajlia and Branjevo. Thus

it will be seen that the invasion covered a front of considerably over a hundred miles and that six strong columns of the enemy had crossed, all of which naturally converged on Valievo. For Valievo was the terminus of a small, single track railroad which joined the main line at Mladenovatz. Thus the Austrians would have a convenient side door open into the heart of Serbia which was, of course their main objective. To this Belgrade was merely incidental. With this line of transport and communication in Austrian hands, Belgrade would fall of itself.

From Losnitza, where the main column of Austrians crossed the Drina, to Valievo, runs the River Jadar, along a level valley, which narrows as it nears Valievo. On the left-hand side of the Jadar Valley rise the southern slopes of the Tzer Mountains, covered with cornfields, prune orchards, with here and there a stretch of thick timber. Continuing southward, slightly to the eastward, up the Jadar Valley another range rises, slightly smaller than the Tzer Mountains, forming a smaller valley which branches off eastward. Along this runs the River Leshnitza, parallel with the Jadar until it makes an independent junction with the Drina. Still further up the valley the foothills of the Iverak ridges are lost in a series of fairly important summits which closely flank the Jadar River.

To the south of the Jadar River the valley stretches into a rolling plain, which rises abruptly into the giant Guchevo Mountains. It is this range, converging with the Tzer and Iverak Mountains toward Valievo, and forming the plain of the Jadar Valley, which was presently to become the center of the first great battle between the Serbians and Austrians.

A military movement against Valievo, therefore, demanded complete possession of these two ridges, which overlooked the line of march. This the Austrians knew well enough, even before the first of their troops had crossed the Drina. As is well known, the best maps, not only of Serbia but of all the Balkan countries, have been made by Austrian engineers. There was probably not a spur, not a fissure, certainly not a trail, of these mountains that had not been carefully surveyed and measured by engineers of the Austrian staff.

The Austrians knew the country they were invading quite as well as did the native Serbians. All through it may be said that it was not through want of accurate knowledge that the Austrians finally met disaster. Rather was it because they misjudged the relative values of their facts. And one of their first mistakes was in overestimating the effects of the two Balkan Wars on the efficiency of the Serbian army. First of all, as was obvious from the leisureliness with which they proceeded to occupy the two mountain chains in question, that they vastly misjudged the capacity of the Serbian troops to make rapid movements. Even as the first shots were being fired across the Drina at Losnitza, the Serbian forces were on the move, westward. Two army corps were at once rushed toward the Valley of the Jadar; part of a third was sent to block the advance of the Austrians from Shabatz. Meanwhile the Austrians took their time. For two days they busied themselves fortifying the bridge at Losnitza.

CHAPTER XLIX

THE GREAT BATTLES BEGIN

ON August 14, 1914, began the first battle of the Serbian campaign. The Austrians proceeded to storm the heights from which the small outpost detachments had all the time been bombarding them with its old-fashioned guns. The Serbians, though few in number, made a desperate resistance. It was their business to hold back the enemy as long as possible, even until the reinforcements should arrive.

Early in the morning of August 14, 1914, the Austrians advanced in a great mass, then charged up the hillsides toward the Serbian position. The Serbians waited until they were well up the steep slopes and the rush of the enemy had subsided to a more toilsome climb. Then they sent down volley after volley from every available weapon.

The Austrian soldiers, who had until then never experienced

anything more warlike than field maneuvers, lost their nerves; the first line broke and ran at the first fire. However, that was likely to happen to any troops under fire for the first time. Down in the plain they formed again, and again they swept up the slopes. This time they did not turn at the first volley. On they came, with fixed bayonets. And presently the first line reached the top of the heights, and the fighting was hand-to-hand. For a moment the Serbians, overwhelmed by numbers, were on the point of fleeing. But these same men had been through many a hand-to-hand encounter with both Turks and Bulgars; that experience stood them in good stead. And again they swept back the attacking masses of Austria-Hungary.

By evening, August 14, 1914, the Austrians had not yet taken the heights. But the Serbians, most of them middle-aged and old men, had spent their vitality. As the dark night lowered over the scene, they fell back, until, at Jarebitze, they met the first advance guards of the oncoming Serbian main army. And here they halted, and the united forces proceeded to dig a trench on a ten-mile front, extending from north to south, through the town and clear across the Jadar Valley. Nor did the Austrians then attempt to follow up this first success. Thus the Serbians were allowed to intrench themselves unmolested until, next day, August 15, 1914, they were joined by the balance of their forces.

Now, by studying the map, it will be seen at a glance that it was only the Tzer Mountains which separated the Austrian column crossing the Drina at Losnitza and the column which had crossed the Save and had occupied Shabatz. Should the Austrians from over the Drina get possession of the Tzer ridges, they would thus effect a junction with the forces in Shabatz, and so form a line that would cut off a large portion of northwestern Serbia. Aside from that, they would have a solid front. But should the Serbians possess themselves of the Tzer ridges first, then they would have driven a wedge in between their two main forces. This would make it difficult for either to advance, for then they would be exposing a flank to the enemy, who would also have a great advantage in position. Moreover, the Serbians would be in a position to turn immediately toward

either of the Austrians' columns, whichever might need most attention.

Meanwhile, the Serbian cavalry had made a reconnaissance toward Shabatz. They immediately sent back reports of overwhelming forces occupying the town. It was out of the question to make any attack there for the present.

It was now learned, for the first time, that another of the enemy's columns had crossed the Drina far down in the south, and was marching on Krupanie, just below the Guchevo Mountains and on the way to the upper part of the Jadar Valley. However, as the first report seemed to indicate that this was only a minor force, a small force of third reserve men was detached to hold this force back and prevent its entrance into the main field of operations.

During the day and night of August 15, 1914, the two opposing forces were moving into position for battle: setting the pawns for the game of strategy that was to be played. The Austrians at Losnitza were advancing up the mountain slopes and took possession of the Tzer and Iverak ridges, straddling the Leshnitza Valley.

Up in Shabatz, Austrian troops were pouring across the pontoon bridges. A flanking column, coming from the Drina, had arrived at Slepchevitch. Another force was stationed with its left and center on Krupani, its right spread out into the mountains north of Liubovia.

On the Serbian side the right wing of the Second Army, screened by the cavalry division, were preparing to cut off the Austrian forces in the north from their juncture with those advancing along the Tzer ridges; the center and left was marching on the enemy on the Iverak ridges, in conjunction with the right of the Third Army, then north of Jarebitze. The center of the Third held the positions south of Jarebitze, while its left, split into small detachments, had been directed to oppose the invasion toward Krupanie and the advance from Liubovia.

Such were the positions of the various forces as dawn broke brightly on the morning of August 16, 1914. As the growing light made objects visible, the extreme right division of the

Serbian front, which was creeping northward to cut off Shabatz, discovered a strong Austrian column moving along the lower spurs of the Tzer Mountains. Obviously this body was clearing the ground for a general descent of the forces up along the ridges; a whole army corps. This movement threatened to become a serious obstacle to the Serbian plan of separating the Austrians in Shabatz from those farther south. But the situation was saved by one of those incidents which sometimes stand out above the savagery of warfare and give to it a touch of grandeur.

A young artillery officer, Major Djukitch, of the Fourth Artillery Regiment, asked permission to go out and meet this body of advancing Austrians with but a single cannon. He would create a diversion which would give the Serbians time to adapt themselves to the changed conditions, though the chances were very largely in favor of his losing his life on this mission. Permission was granted. Calling on volunteers from his command, he advanced with his single cannon and took up a position in the path of the approaching enemy. The moment he opened fire the Austrians, naturally not realizing that only one cannon was opposing them, and believing that a large Serbian force had surprised them, broke into a panic. Half an hour after he had opened fire, the Serbian field commander sent a messenger to Major Djukitch, ordering him to retire. In reply he sent a message to the commander, describing the confusion he had created in the Austrian ranks, and instead of retiring, he asked for reinforcements. The balance of his own battery, a detachment of infantry, and a cavalry division was sent him. The result was that the Austrian column was temporarily driven back into the mountains. Hastily re-forming, the Austrians now massed along a line extending from Belikamen to Radlovatz, while the Serbians deployed along a front running from Slatina through Metkovitch to Gusingrob.

At 11 a. m., August 16, 1914, the two opposing forces opened fire in earnest, up and down the line. All day the cannon roared and the rifles and machine guns crackled; now and again the Austrians would shoot forth from their line a sharp infantry

attack, but these were repulsed, with more and more difficulty as the day advanced, for the Serbians were much inferior in numbers. Toward evening their situation became very critical. Yet every part of the line held out desperately, knowing that reinforcements were being hurried forward from the rear as fast as men could move.

And just before dark, along the roads from the eastward, came the distant cheers from the advancing columns. An officer dashed, upon horseback, shouting encouragement to the battered men in the trenches. A cheer arose, which rolled up and down the line. Again it rose, then, even before it had died out, with wild yells the Serbians sprang over their breastworks and swept madly across the intervening space to the Austrian lines; smashing through cornfields, over rocks, through the tall grass of orchards. At their heels followed the reenforcing soldiers, though they had that day marched nearly sixty miles. Over the Austrian breastworks they surged, like an angry wave from the sea, their bayonets gleaming in the sunset glow. It was the kind of fighting they knew best; the kind that both Serbians and Bulgars know best, the kind they had practiced most.

Small wonder if the inexperienced peasants from the plains of Hungary, unused till then to any sight more bloody than a brawl in the village inn, trembled before this onslaught. Their officers shouted encouragements and oaths, barely audible above the mad yells of the Serbians. Nevertheless, they gave way before the gleaming line of bayonet blades before them. Some few rose to fight, stirred by some long-submerged instinct generated in the days of Ghengis Khan. But the majority turned and fled, helter-skelter, down the sides of the mountains toward the valleys, leaving behind guns, ammunition, and cannon. One regiment, the Hundred and Second, stood its ground and fought. As a result it was almost completely annihilated. The same fate befell the Ninety-fourth Regiment. But the majority sought and found safety in flight. By dark the whole Austrian center was beaten back, leaving behind great quantities of war material.

1

CHAPTER I

FIRST VICTORY OF THE SERBIANS

THE Serbians had made their first move successfully on that day of August 16, 1914. More important than this mere preliminary defeat of the enemy was the fact that the Austrians in Shabatz were now definitely cut off from any possible juncture with the Austrians in the south. For the present they were debarred from entering the main field of operations. This freed the Serbian cavalry for action elsewhere. Meanwhile a portion of the right wing of the Serbian line was detached to keep the Austrians inside Shabatz.

Farther to the south the Serbians were not so decidedly successful. The center of the Serbian Second Army: that directed against the southern slopes of the Tzer Mountains and the Iverak ridges, had arrived at Tekerish at midnight.

As dawn broke on August 16, 1914, they perceived a strong Austrian column descending from above, coming in the same direction. Unfortunately the Serbians were in the midst of bald, rolling foothills, while the Austrians were up among the tall timber which clothes the mountain slopes at this point. The Serbians deployed, extending their line from Bornololye through Parlok to Lisena, centering their artillery at Kik. The Austrians made the best of their superior position.

For some hours there was furious firing, then, at about eight o'clock the Austrian gunners got the range of the Serbian left flank with their field pieces, which was compelled to fall back. But just then timely reenforcements arrived from the rear, and the Serbians dug themselves in. By evening the Serbians had lost over a thousand men, though they had succeeded in taking 300 prisoners and several machine guns from the Austrians.

The left wing of the Second Army had, in the meantime, arrived against Iverak. That this division was able to arrive at such a timely juncture was due to its having made a forced march of fifty-two miles over the mountain roads during the previous day.

Yet before dawn on the morning of August 16, 1914, it was ready to continue its march to Poporparlok. But then came the news that the Austrians had driven back the left wing of the Third Army from that position and had occupied it.

The situation in which this division found itself was by no means clear. Nothing had been heard from Shabatz. The division operating along the Tzer ridges had been badly hammered. The Third Army had lost Poporparlok. The commander decided to stay where he was and simply hold the ground against any advance of the enemy from Iverak. This division was, therefore, intrenched along a line from Begluk to Kik, and a strong advance was thrown out toward Kugovitchi. During the morning this advance guard made a strong attack against Kugovitchi, drove the Austrians out, and established themselves there.

At dawn, August 16, 1914, the left flank of this division, at Beglok, was shelled by the Austrian artillery, which was followed by infantry attacks. These were easily repulsed during the day. But then the enemy was reenforced, and late that night they came on again in great masses. The Serbians allowed them to almost reach their trenches: then, emptying the magazines of their rifles at them, they piled themselves over their breastworks and into them with bayonets and hand bombs. This was too much for the Austrians; they fled in wild disorder.

Least encouraging was the experience of the Serbian Third Army, which was defending the territory south of the Iverak Mountains. Here the Austrians developed a vigorous and persistent offensive, hoping to turn the Serbian left and thus capture the road to Valievo.

The attack on the positions at Jarebitze commenced at day-break on August 16, 1914. Here the Serbians held good ground: rocky summits, but so limited in extent that there was room only for a few companies at a time. On the other hand the ground before them was broken up into hollows screened by growing corn. This enabled the Austrians to deploy their lines beyond the Serbian flanks unseen. They did execute just such a movement, and attempted to circle around toward the Serbian rear.

At the same time the Serbians here were attacked from in

front by another hostile column which had come from across the plain on the south side of the Jadar valley, where hollows, sunken roads, and fields of corn again formed ample screening. However, in spite of all these movements, the Serbians were able to hold their own. The Austrian attacks were all beaten back. Their position might have been held indefinitely, but developments to the south were taking on a threatening form.

It will be remembered that an Austrian force had been reported approaching from the south, moving on Krupanie, and that it had seemed so insignificant that a small detachment of third reserve troops had been sent to hold it back. But this enemy force now developed into three brigades of mountaineers.

Reenforcements of infantry and mountain artillery were hurried down to support the retaining force, but the Austrians were able to force their way on toward Zavlaka. Seeing Valievo thus threatened, the Serbians retired from their position at Jarebitze and took up a new position along a line from Marianovitche to Schumer, thus enabling them to face both the enemy columns. This retreat was fortunately not interfered with by the Austrians, though in executing it the Serbian artillery, which had been in position on the right bank of the Jadar, was obliged to pass along the Austrian front in single file, in order to gain the main road.

Early the next morning, August 17, 1914, the Serbians were in position and had extended their line to Soldatovitcha, whence the detachment from Krupanie had retired. Summing up the day's fighting, and considering it as a whole, it will be seen that the Austrians had pretty well held their own, except on their extreme left, where they had failed to get in touch with their forces in Shabatz.

After the defeat of the Austrians at Belikamen on August 16, 1914, the cavalry division was reenforced by some infantry and artillery, then sent on the delicate mission of driving a wedge in between the Austrians in Shabatz and those along the Drina. Spreading out across the Matchva plain, its left wing up against the slopes of the Tzer Mountains, and its right wing within reach of Shabatz, it advanced as far as Dublje in the north. At the

same time it was able to assist the column advancing along the Tzer ridges by playing its artillery on the Austrian position in the mountains at Troyan. Throughout all the fighting this cavalry division rendered notable service by its dismounted action.

On the morning of August 17, 1914, the extreme right of the Serbian front now turned toward Shabatz. Though only half the number of the forces they were proceeding to engage, they continued onward. But on closer approach it became apparent that they could do nothing more than hold the Austrians inside the town. So well and so thoroughly had the Austrians fortified themselves that it was hopeless for so small a force to attempt an attack. Thus this section of the Serbian front settled down to wait for reenforcements.

The center and left of the Second Army now prepared to advance along the Tzer and Iverak ridges. The Austrians in this section, who had suffered so severely the day before at Belikamen, were now concentrated around Troyan, the most easterly and the second highest peak of the chain.

At dawn on August 17, 1914, the Serbians located the Austrians. Immediately they began a heavy artillery fire on this position, then proceeded to infantry attack. Two regiments hurled themselves up the slopes, and with bayonets and hand bombs drove the Austrians back. After that no further progress was possible that day, the Serbians having to wait for their artillery to come up. The Austrians now began intrenching themselves on the heights of Kosaninograd, the loftiest portion of the Tzer range.

Along the Iverak ridges the Austrians made a determined advance. The situation of the Serbian troops in this section, the left wing of the Second Army, was extremely dangerous, for their left flank was becoming exposed by the continued retreat of the Third Army. The only hopeful aspect of their situation was that the Austrians were also having their left flank exposed by the retreat of the Austrians along the Tzer ridges. Evidently the opposing forces realized this fact, for they made a fierce attempt to drive back the Serbians opposing them, so that their danger from the north might be lessened. Half an hour later

they were severely repulsed. But heavy reenforcements came up to the Austrians just then, and again they attacked, this time more successfully.

By noon, August 17, 1914, the Austrians had extended their line over to the Serbian right wing.

Unfortunately, at about that time the Third Army again called for assistance, and this hard-pressed division was compelled to send it. The result was that it was compelled to withdraw gradually to the heights of Kalem. The retirement was executed in good order, and the Austrians satisfied themselves with occupying Kugovitchi. Intrenching themselves in their new position, the Serbians awaited further attacks. Only an ineffectual artillery fire was maintained by the enemy. Meanwhile came the good news of the success of the Serbians along the Tzer ridges, so preparations were made for another advance on the following day, August 18, 1914.

As has already been stated, the extreme south wing of the Serbian front, the Third Army, had retreated the day before so that it could present a solid front against not only the forces opposing it, but also another column coming up from the south, whose advance had been inadequately covered by third reserve men. Here the Austrians attempted to pierce the Serbian line in the extreme south and come out at Oseshina. But though vastly outnumbered, the Serbians held their ground stoutly until late afternoon, when, as already shown, they were compelled to ask the division operating along Iverak for assistance. When this help came they were able to resume their defense.

Thus ended the second day of the general battle. On the whole the Austrians had suffered most, but the general situation was still somewhat in their favor. The Austrian center, along the Tzer ridges, had been pushed back. To retrieve this setback the logical course for the Austrian commander in chief was to curl his wings in around the Serbian flanks. That he appreciated this necessity was obvious, to judge from the furious onslaughts against the Serbian Third Army in the extreme south. But to weaken the Serbian center by these tactics it was also necessary to free the Austrians in Shabatz, or, at least, it was necessary

that they should assume a strong offensive against the extreme right of the Serbians, and, if possible, flank them.

But the Serbians anticipated the plans of the Austrians. Additional reenforcements were sent to the extreme right with orders to spare no sacrifice that would keep the Austrians inclosed within their fortifications around Shabatatz.

And true enough, next morning, August 18, 1914, shortly after the hot summer sun had risen over the eastern ridges, the Austrians emerged from Shabatatz and attacked the Serbians. The Austrian onslaught was furious, so furious that, step by step, the Serbians, in spite of their reenforcements, were driven back. Fortunately toward evening the Austrian offensive began losing its strength, and that night the Serbians were able to intrench along a line from Leskovitz to Mihana.

This obliged the cavalry division, which had been cooperating with the Serbian center and was driving the Austrians toward Leshnitztza, to retire along a line from Metkovitch to Brestovatz. Naturally the advance of the Austrians from Shabatatz was endangering its right flank. Moreover, a reenforced column of Austrians also appeared before it. But this opposing force did not press its advance.

Meanwhile, on the same day, August 18, 1914, the Austrians were reenforcing their position on the Tzer ridges. They had also strongly fortified the height of Rashulatcha, which lay between the heights of Tzer and Iverak, whence they could direct an artillery fire to either field of activities.

But the difficulties which the Serbians operating along the Iverak ridges were meeting also hampered the Serbians who were attempting to sweep the Austrians back along the Tzer ridges. If they advanced too far they would expose their flank to the Austrians over on Iverak. As a general rule, it is always dangerous for any body of troops to advance any distance beyond the general line of the whole front, and this case was no exception. However, though delayed, this division did advance. Oxen were employed in dragging the heavy field pieces along the trails over the rocky ridges.

With savage yells the Serbian soldiers leaped over the rocks,

up the jagged slopes of Kosaningrad. Again they had fallen back on their favorite weapons; bayonets and hand bombs. The Austrians put up a stout resistance, but finally their gray lines broke, then scattered down the slopes, followed by the pursuing Serbians. Having gained possession of Kosaningrad Peak, the Serbian commander next turned his attention over to Rasulatcha, which, in conjunction with the Serbians over on Iverak, could now be raked by a cross artillery fire. He had previously left a reserve force behind at Troyan. This he now ordered to reenforce his left, which had been advancing along the southern slopes of the Tzer range. This force he now directed against the heights, but the movement was not vigorously followed up.

Over on Iverak the Serbians had succeeded in making some headway. Forming into two columns, this wing marched out and attacked the Austrians at Kugovitchi and succeeded in driving them from their trenches. But immediately the Austrian artillery on Reingrob opened fire on them, and they were compelled to dig themselves in. And late that night, August 18, 1914, the Austrians delivered a fierce counterattack. But night fighting is especially a matter of experience, and here the Serbians with their two Balkan campaigns behind them, proved immensely superior. They drove the Austrians back with their bayonets.

During that same day, August 18, 1914, the Austrians had renewed their pressure on the Third Army and the Third Ban men. Soldatovitcha was their first objective. During the day reinforcements arrived and the commanding general was able to hold his own, retaking Soldatovitcha after it had once been lost. Thus ended the day of August 18, 1914, the third day of the battle.

Early next morning, on August 19, 1914, the Austrians in Shabatatz renewed their efforts to penetrate the Serbian lines to the southward. So determined was their effort that finally the Serbians in this sector were driven back over on to the right bank of the River Dobrava. All day the fighting continued, the Serbians barely holding their position, strong as it was.

This success of the Austrians hampered the cavalry division, which had not only to secure its flank, but had also to keep between the Shabatz Austrians and the Serbians operating on Tzer, whom they might have attacked from the rear.

Along the Tzer ridges, however, things were going well for the Serbians. At noon they had taken Rashulatcha, which left the column free to continue its pursuit of the fleeing Austrians along the ridges. From the heights above the Serbian guns fired into the retreating Austrians down along the Leshnitsa River, turning the retreat into a mad panic. By evening the advance guard of this division had arrived at Jadranska Leshnitsa.

In the early morning, August 19, 1914, the Serbians over on the Iverak ridges had attacked in deadly earnest. Naturally the huge success and rapid advance of the Serbians over on the Tzer ridges was of great importance to them. Here the Austrians were put to rout too. At 11 a. m. the Serbians stormed Velika Glava and took it, but here their progress was checked by a strong artillery fire from the west of Rashulatcha. Then rifle firing broke out along the whole line from Velika Glava to Kik. Near Kik the Austrians were massing in strong force, and the Third Army was reported to be again in danger, this time from a hostile turning movement. Fortunately general headquarters was able to come to the rescue with reinforcements. This lessened the danger from Kik. Whereupon the advance along Iverak was continued. By the middle of the afternoon, when the Austrians were driven out of Reingrob, the Serbians controlled the situation. The defeat of the Austrians was complete.

The Third Army was again in trouble during this day, August 19, 1914. Its left flank continued its advance from Soldatovitcha, but the Austrians attempted to pierce their center. But finally this sorely tried section of the Serbian front emerged triumphant. Before evening the Austrians were driven back in scattered disorder, leaving behind them three hospitals filled with wounded, much material, and 500 prisoners.

Here ended the fourth day of the bloody struggle—August 19, 1914. In the north around Shabatz the Austrians had made some advance, but all along the rest of the line they had suffered com-

plete disaster. The two important mountain ridges, Tzer and Iverak, which dominated the whole theatre of operations, were definitely in the hands of the Serbians. And finally, the Third Army had at last broken down the opposition against it.

Next morning, August 20, 1914, dawned on a situation that was thoroughly hopeless for the Austrians. Even up around Shabatz, where they had been successful the day before, the Austrians, realizing that all was lost to the southward, made only a feeble attack on the Serbians, who were consequently able to recross the Dobrava River and establish themselves on the right bank.

The cavalry division, whose left flank was not freed by the clearing of the Tzer ridges, hurled itself against the Austrians in the plains before it and threw them into wild disorder. First they shelled them, then charged. The panic-stricken Magyars fled through the villages, across the corn fields, through the orchards.

"Where is the Drina? Where is the Drina?" they shouted, whenever they saw a peasant. A burning, tropical sun sweltered over the plain. Many of the fleeing soldiers dropped from exhaustion and were afterward taken prisoners. Others lost themselves in the marshy hollows and only emerged days later, while still others, wounded, laid down and died where they fell.

In the Leshnitztza similar scenes were taking place. From the ridges above the Serbian guns roared and poured hurtling steel messages of death down into the throngs of retreating Austrians. Some few regiments, not so demoralized as the others, did indeed make several attempts to fight rear-guard actions, to protect their fleeing comrades, but they again were overwhelmed by the disorganized masses in the rear pouring over them.

In the Jadar valley another disorganized mob of Austrians was fleeing before the Serbians up on the Iverak ridges, who also were pouring a hot artillery fire into their midst. Presently the Third Army joined in the mad chase. And now the whole Austrian army was wildly fleeing for the Drina River.

There remained only one exception during the early part of the day, August 20, 1914. This was the Austrian forces on Kik, to the northwest of Zavlaka. The Serbian reinforcements which,

it will be remembered, had originally been directed toward Marianovitch, had been afterward sent westward, and at dawn on August 20 they approached Kik in two columns. The left column occupied Osoye without resistance, but in descending from that position, the Austrian artillery opened fire on it.

An hour later the right column came up and opened an artillery fire, and under cover of this bombardment a Serbian regiment reached the foot of the mountain. As was afterward learned, the Austrians at this point had had their machine guns destroyed by the Serbian artillery fire, and by this time their own artillery had been sent back, in preparation for the retreat. Consequently they were only able to receive the Serbian attack with rifle fire.

At the height of this skirmish the extreme left of the Serbians on Iverak, which had remained to guard against attack from this quarter, moved over against the Austrians. The cross fire was too much for them; they turned and fled, leaving behind over six hundred dead, the Serbians in this affair losing only seven killed. Jarebitze was now occupied; the rest of the Serbians joined in the general pursuit.

That night, August 20, 1914, the Austrians swarmed across the Drina, fleeing for their lives. By the next day the whole river bank was cleared of them. Serbian soldiers lined the whole length of the frontier in this section. There remained now only the Austrians in Shabatz to deal with. The whole Serbian army was now able to concentrate on this remaining force of the enemy left in Serbian territory.

Early on August 21, 1914, the attack began, and the Austrians here fought stoutly. Indeed, all that day they held the Serbians off from behind their intrenchments. On August 22, 1914, the Serbians made a general assault. Fortunately they found a weakness in the fortifications on the western side of the town. To create a diversion, the Austrians delivered a counterattack along the road toward Varna.

By the morning of August 24, 1914, the Serbians had brought up a number of heavy siege guns. But when the general bombardment had already commenced, it was found that the Aus-

trians had evacuated the town during the night, and retreated across the river. And so the first Austrian invasion of Serbia came to its disastrous end.

CHAPTER LI

RESULTS OF FIRST BATTLES

THOUGH described as a punitive expedition in the Vienna press, this campaign cost the Austrians very dear, not only in material and in lives, but in prestige. Just what the Austrian casualties were cannot be definitely stated at this time, but at least six thousand were killed outright on the field of battle, while at least 35,000 were wounded. And another 4,000 fell into the hands of the Serbians as prisoners. In material the Serbians report that they captured 46 cannon, 30 machine guns, 140 ammunition wagons, and a great mass of rifles, hospital paraphernalia, ammunition, stores, and other incidentals.

The Serbian losses were heavy : 3,000 dead and 15,000 wounded. That they were so much less is not extraordinary, for not only were they on the defensive, but an army in flight, as were the Austrians, always loses heavily.

The first invasion failed. But that did not mean that the Austrians themselves had given up their determination to conquer Serbia. The three months of comparative quiet that followed were only the lull that comes before the heaviest period of a storm.

The first onslaught of the Austrians in August, 1914, had been driven back. A disorganized mob, the soldiers of Franz Josef had fled back across the Drina and the Save, leaving thousands of dead and prisoners behind. And for over a week the little Serbian army lay panting.

Military science says that a victory should always be followed up closely, for a beaten army is almost as helpless as a herd of cattle. But military science must also take into account the

limitations of human muscles and nerves. The Serbian reserve forces had been running back and forth along the fighting front, strengthening a defense here, supporting an attack there, and some of them had covered from fifty to sixty miles a day. There were no fresh troops to pursue the Austrians. The Serbians needed rest. And so the Austro-Hungarian soldiers were allowed to continue their northward flight unmolested, once they had crossed the rivers.

However, there were additional reasons why the Serbian General Staff did not think it advisable to follow up the enemy at once, or even a day or two later, when the soldiers had thoroughly rested. For one, there had been a heavy expenditure of ammunition, especially by the artillery, and that needed to be replenished. A supply was expected along the railway from Greece, through Macedonia. After all, Serbia was now reaping the results of having done just what the Austrians had been attempting to do against her. She had crushed the national spirit of the Macedonian Bulgars with a ruthless hand. She was now learning that there was a heavy price to pay. Had she, in the height of her power, been just, it is more than probable that all the Bulgarian people would now have been lined up with her against the Austrians, for all the Balkan Slavs thoroughly detest the "Schwaba," as the German-Austrians are called.

Another difficulty attending a counterinvasion had also to be solved. Naturally the fleeing enemy had stripped the river banks of all barges, boats, and such timber as could be utilized in constructing sufficient bridges for the crossing of an army. And finally, it was a serious question whether the Serbians, with their limitations of number, could afford to extend their lines by increasing the territory to be held. As it was, before the Austrians had been definitely beaten, they had put every available man into the extended firing line.

Thus for twelve days after the battle of Shabatz, or from August 23, 1914, there was quiet along the Austrian and Serbian frontier. The remnants of the Austrians had definitely retired northward. And at about that time the Russians were driving hard at the Galician front. The Austrians were being beaten

there, too. Altogether the situation looked extremely serious for Austria at that time. But, finally, encouraged by the Allies, the Serbian General Staff decided to send an expedition over into Austrian territory.

On account of the sparsity of railroads leading north from the lower part of Bosnia, it was more difficult for the Austrians to concentrate troops in that region than over toward Belgrade, north of the Serbian frontier. In this latter region, known as Syrmia, the better railroad communication enabled the Austrian General Staff to concentrate forces more speedily, within immediate striking distance of that section of the Serbian frontier between the Danube and the Drina.

Not much over twenty miles north of Shabatz is a range of mountains, called the Frushkagora. A fairly strong force holding these rocky ridges would be in a position to prevent the Austrian general from reenforcing his armies in Bosnia and Herzegovina from the east. It would also afford a better protection to the northern frontier of Serbia than would a force of the same size stationed within Serbian territory along the Save River. The chief thought of the Serbian general was, however, to gain control of this natural position and hold it while another Serbian force was invading Bosnia, in conjunction with the Montenegrin troops. What made this first objective the more tempting was the known fact that between the frontier and the Frushkagora range the Austrian forces amounted only to about a dozen regiments.

To the First Army, General Putnik assigned the execution of this expedition. That was now composed of two divisions, and the cavalry division, which had rendered such excellent service on the Matchva Plain during the first invasion. The left wing of this expeditionary force was to be supported by a division in Matchva, while the "Detachment of Belgrade" was to operate on the right. A second reserve division was to hold Obrenovatz, while the rest of the Serbian forces were to remain along the Drina, to advance toward Sarajevo.

Another glance at the map will show that, almost halfway between Shabatz and Belgrade, the Save takes a peculiar little

loop into Serbian territory, forming a narrow strip of Austrian territory projecting into Serbia. Naturally, this little tongue could be commanded by the Serbian guns without first crossing the river, since the Austrians could only operate here by marching down in a narrow column between the two sides of the loop formed by the river. Such a force, however, could be immediately flanked by the Serbians from their side of the river. This peculiar peninsula, known as the Kupinski Kut, was chosen as the point at which the first crossing should be made.

CHAPTER LII

SERBIAN ATTEMPT TO INVADE AUSTRIAN TERRITORY

IT was the night of September 5, 1914. So secretly was this movement planned and begun that the Serbian field officers did not themselves know what was to be undertaken when their forces arrived on the banks of the river at the Kut on the nights of September 5 and 6. The marches were made at night, to hide the movement as long as possible from the Austrian aeroplanes, which occasionally whirled their flight over Serbian territory.

At one o'clock in the morning of September 6, 1914, the first troops of the invading expedition embarked on the barges lined up along the river bank. A screening force having been ferried across, to protect the ford against possible attack, the construction of a pontoon bridge was begun at Novoselo, while farther up some flour mill floats were utilized for a second bridge.

It was an ideal place for a crossing. Farther up, at the neck of the isthmus, was an old river bed, where the Save had once cut a straight channel. This was now full of stagnant water, while between it and the ford the ground was covered with thick timber. The stagnant water, while not very deep, afforded somewhat the same protection that a wire entanglement would, and the woods served as a screen to the advance guard of the Serbians

stationed there to guard the crossing. Not far distant, farther up in Austrian territory, was a small town, Obrez.

After the Serbian army had crossed safely, it set to work clearing the timber away, it being no longer necessary to screen themselves from view, and a strong line of trenches was thrown across the neck of the isthmus, thus effectually protecting the ford for retreat, should that be necessary.

At this moment two regiments of infantry and a battery of artillery of the enemy appeared and attempted to oppose the further advance of the Serbians, but when the Serbian guns began shelling the forest opposite, this force fled in the direction of Obrez. Then the left of the Serbian force worked its way around toward the town itself and, after firing some dozens of shells, entered it and drove the Austrians still farther on.

The cavalry division now came up to secure possession of the town. The two divisions then set to work to intrench themselves. Meanwhile the Serbian right, advancing toward the northeast, encountered another force of the enemy, consisting of one regiment and two batteries, and, after a short skirmish, drove it back and occupied the two villages, Kupinovo and Progar. Thus the Serbian operations in this section fared well.

But at another point, on the extreme left, at Mitrovitza, they did not encounter such good fortune. The division operating here was to occupy and fortify Mitrovitza and with it a bridge, after which it was to advance and worry the enemy's flank. The actual point chosen for the construction of the bridge was a customs station at Jasenova Grada, between Mitrovitza and Jarak.

The column here had arrived at the river bank at midnight of September 5, 1914, and at early dawn had begun building the pontoon bridge. Meanwhile a steady artillery and rifle fire was kept up, sweeping the opposite bank, to keep back the enemy. The Serbian commander of this force had received instructions to the effect that as soon as he had moved his troops across safely, he was to send two regiments forward: one to the right, the other to the left, and the whole line was to advance and cover the territory between Mangjeloskabara and Shashinshi, the object being to push back any movement of the Austrians from Jarak.

As at Novosela, an advance guard crossed in barges before the bridge had been thrown across. Immediately a heavy fire began from the enemy, hidden in the opposite forest. Many of the Serbians threw themselves into the river, and either swam or waded the rest of their way across.

Finally three barge loads had effected a crossing. While waiting for the rest to follow, sixty of the Serbians threw themselves over against the Austrians and, by their very boldness, drove them out of their trenches and took twenty prisoners.

Some delay in the building of the bridge followed, but more barge loads of soldiers were sent across, and the fighting with the Austrians was pushed vigorously. But meanwhile the enemy was also being reenforced, more rapidly for not having a river behind him. By evening the Serbians, who had crossed, found themselves tremendously outnumbered and fighting on the defensive. At that time, one of the Serbian regiments, which had advanced as far as Shashinshi, found itself isolated, with both flanks exposed.

After two hours of stubborn fighting the regiment managed to draw back to the river bank, carrying with them a mass of wounded comrades, hoping there to find the support of the main body of their army. But the pontoon bridge had not yet been completed. Of the 400 yards across the river, only twenty remained unbridged. Seeing their advantage, the pursuing Austrians redoubled their attack furiously. The Serbian regiment, with half its men down, and only 60 feet of water between itself and the main corps, turned, with its back to the river, and fought back with equal fury.

With frantic haste, the Serbian engineers attempted to finish the building of their bridge, so that the main body of the troops might rush across and relieve the situation of the regiment defending itself against overwhelming numbers on the opposite bank. But before this could be accomplished, the wounded began throwing themselves into the pontoon nearest their side of the river. The mooring lines parted and the barge drifted away from the end of the bridge, down the river, loaded with wounded soldiers. The same happened to the next barge. To add to the

disaster, the barges were old and leaky, and soon one of them filled with water and began sinking. Presently it sank, throwing the wounded into the river, where most of them were speedily drowned.

The Serbians on the Austrian shore, now seeing their last hope of support or escape cut off, continued fighting desperately until all their ammunition was gone. Then the handful of survivors surrendered. By this time it was already dark. The only one to escape across the river was the regimental surgeon who, carrying the regimental flag between his teeth, swam across the river and reached the main body of his countrymen safely.

Fortunately, the recklessness which led this attempted crossing to disaster did not characterize the movements of the main body which had crossed at Novoselo. The advance continued under carefully thrown out screens of cavalry, and was kept up until the trenches at the landing could be abandoned and a wider circle of defensive works could be thrown up, including within their line the villages already mentioned. Thus the three Serbian bases were strongly protected by a semicircle of field works, radiating from Kupinovo. Having secured this position, General Boyovitch, the Serbian field commander, advanced his cavalry in fanlike formation to the north and west. One division followed the cavalry on the right; another took a northeasterly direction.

By the evening of September 7, 1914, the enemy had been driven back to a line reaching from Detch to Nikintzi. No serious encounters occurred for some days, the Austrians evidently not desiring to make any serious opposition until they should have sufficient backing. But on the morning of September 9, 1914, the Serbian right came in contact with strongly entrenched Austrians at Detch and Surchin. During the first invasion the fighting had been under a tropical sun. Now the weather was cooler, almost cold at nights, which rendered the enthusiasm and the fighting of the men on both sides correspondingly more spirited. It was, therefore, with some vim that the Serbians threw themselves into an attack against Detch.

SERBIAN ATTEMPT TO INVADE AUSTRIA 327

After a determined resistance, the Austrians were forced out. Next Surchin became the center of battle, but here the Austrians held out stoutly, driving back the Serbian charges again and again.

All that day of September 9, 1914, the Serbian advance was checked, but the following morning, being reenforced, they charged into Surchin again and finally drove the Austrians out at the point of the bayonet. The Serbians then turned north and captured Dobranovtsi. And at this junction the Serbians stationed at Belgrade crossed the river there and advanced on Semlin.

On September 11, 1914, General Boyovitch moved his whole front forward, with the object of driving all of the enemy westward into the Frushkagora Mountains and gaining full possession of the plain. This would have left the two divisions and the cavalry free to advance against the mountain range itself. Having once gained that stronghold, the Serbians would then have under their control the whole district of Syrmia with its friendly population of Serbs.

The Serbians were now extended along a front from Hrtkovtsi to Pazova Nova while the Austrians were intrenched along a line from Jarak to Pazova Stara. The following morning the Serbian left occupied Pechintsi and advanced north to the Romer Canal, where they met a heavy fire and were compelled to entrench themselves. Farther west, however, the Serbians rushed the town of Jarak and took it by means of bayonets and hand bombs.

Such was the situation on September 12, 1914, when a bright, clear morning had dawned and a cool breeze swept over the plain. Off in the distance rose the blue ridges of the Frushkagora Mountains, streaked with the green of vegetation along their lower spurs. With tingling blood and renewed vitality the Serbians looked forward to the word of command which should send them onward, driving the Austrians before them.

But that word of command seemed long delayed. Finally, indeed, it came, but only to the cavalry. The horsemen were sent ahead, up and down the line, screening the men in the

trenches. And then suddenly came the word to the men in the trenches.

"March!"

They did fall in and begin to march. But not forward. The heads of the columns turned toward the rear, back toward Serbia. Presently the whole Serbian army, just as farther victories seemed all but won, was on the retreat. Behind them they heard the fire of their own cavalry, protecting their rear. The retreat was orderly and the river was recrossed without loss or confusion. Even more concerned and disappointed were the Serb peasants of the villages through which they passed, for these simple folk had thought the Magyars permanently beaten and that King Peter's men were now moving onward to take Vienna. They had, therefore, shown unmeasured enthusiasm and had showered gifts of chicken, milk, eggs and other rural dainties on their brother Serbs from Serbia, to the full extent of their slender resources. A few days later they had to pay dearly for this manifestation of their sympathies. When again the Magyars came down into their territory they became so oppressive of these poor villagers that a Croatian regiment, whose members were racially akin to the Serbs, broke into open revolt and attacked the Magyars, the result being a pitched battle in which not only rifles, but machine guns and cannon were employed. Presently word was passed back and forth among the rank and file of the Serbian army explaining the disappointing retreat.

"The Austrians are swarming across the Drina again," their officers whispered. "There will be plenty of fighting yet, but it will be the same old battle ground."

Thus ended Serbia's brief invasion of Austrian soil.

CHAPTER LIII

AUSTRIA'S SECOND INVASION

THE second Austrian invasion of Serbia began September 7, 1914. Had the Serbian General Staff known what mighty efforts the Austrians were to put forth at this second attempt to invade the country, it would never have undertaken the expedition into Syrmia. After the failure of the first invasion the Austrian staff placed at General Potiorek's disposition a force of 300,000 men, with a reserve of another 150,000 to draw upon, should the necessity become strong enough. Fortunately for the Serbians the Russian pressure in Galicia became so strong, later on, that this reserve force was sent through the Carpathians, and when the critical moment did arrive, General Potiorek was unable to avail himself of its assistance.

It may be well to know how the Austrian forces were disposed just before the second invasion. There were five whole army corps; one was stretched out from Klenak to Bosut; another from Bosut to Bijeljina; another from Janja to Kosluk and another from Kosluk to Zvornik. Aside from this force there was part of another corps lined up from Zvornik to Liubovia and one and a half divisions held the front from Semlin to Weisskirchen. Four battalions were kept busy by the Montenegrins.

It will be remembered that when the expedition into Syrmia began the bulk of the Serbian army was sent to the western frontier along the Drina, to be ready to invade Bosnia when the success of the Syrmia expedition should be assured. But so well is Bosnia wooded in this section that the Serbians had not been able to observe the concentration of troops that was going on before them across the Drina.

Suddenly, on the morning of September 7, 1914, the whole frontier along the Drina, from Jarak south, became alive with Austrian soldiers. North of Loznitza the fighting took on a very bloody and deadly character. All day the battle line swayed back and forth with a succession of attacks and counterattacks.

Several times the Austrians almost broke through, but in the end their whole line was driven back across the river. In the Matchva district, however, they succeeded in holding a triangular patch of swamp land, bounded by Ravjne, Tolich and Jarak. But even here they were checked along a line from Ravjne to Tolich, where both sides entrenched and came to a deadlock for the time being. Here the two opposing lines continued their trench warfare without much spectacular demonstration, but with a tremendous loss of life to both sides and an expenditure of ammunition which the Serbians could little afford.

Along the line south of Loznitza the fighting was not so favorable to the Serbians. The forces stationed here had been weakened in the Syrmia expedition. And then, too, the country being extremely mountainous, they had overestimated the strength of their positions.

Here, on the morning of September 8, 1914, the Austrians began a general advance, beginning at Ljubovia. At first they were successfully held back, but when they came on again with greatly augmented numbers, the Serbians were finally compelled to retire to a line of hills running from Guchevo, through Jagodina and Proslop to Rozani, where they intrenched themselves and prepared to resist any further advance.

The Austrians, however, continued to attack. Around Kru-pani below Loznitza, the Serbians made a stubborn defense and succeeded in holding the heights of Kostainik. But their southern, or left, wing continued to be driven back.

By September 11, 1914, the Austrians had advanced as far as a line drawn from Shanatz to Petska. At this critical moment, however, one of the divisions of the force that had been recalled from Syrmia arrived and the combined forces were ordered to advance against the Sokolska Mountains, whose ridges were occupied by the Austrians.

The Serbians rushed the heights with their customary élan. The Austrians resisted stubbornly. They, in their turn, had been tasting the first draughts of victory, and were not so prepared to give in as on previous occasions. For a long time the fighting was hand to hand. The men even hurled big rocks at

each other, grappled together in each others' arms and fought with knives and teeth. But finally some of the Austrians broke and scattered and presently all of them fled. Their trenches and ground on both sides of them, however, were covered with dead, Serbians and Austrians promiscuously mingling together.

So complete was the Serbian victory that their troops were now able to advance and form a new line from Shanatz to Brodjanska Glavitza, with the cavalry patrolling clear down to the Drina at Liubevia.

Further north, however, the Austrians were still in possession of Matchko Kamen (Cat Rock). Here the fighting had been most terrific, the heights having been taken and retaken no less than eight times. This position dominated all the country around within artillery range. By taking this strategic point the Serbians would have had complete possession of a chain of heights which begin with Guchevo on the north, and would have constituted a natural frontier which could have been held with a minimum force of troops and expenditure of ammunition. But this move was not carried out. Both sides were literally tired out. The Serbians were unable to advance any farther, while the Austrians were content with not being driven back any farther. They were, also, no doubt worried by the fact that down in the southern section the Serbians had succeeded in not only driving the Austrians across the river, but had even advanced some distance into the Bosnian hills.

CHAPTER LLV

END OF SECOND INVASION—BEGINNING OF THIRD

THUS the second Austrian invasion was checked. The strategy was, perhaps, not so spectacular as in the first invasion, but the losses to both sides had been much heavier. In killed, wounded and prisoners the Serbians lost fully 30,000 of their men. There

now followed a situation somewhat similar to that up in northern France; both sides were deeply intrenched and in some parts faced each other over only a few yards of neutral ground. Again and again the Austrians delivered attacks, attempting to break through the Serbian positions. All the arts of trench warfare were employed by the Austrians to overcome the Serbian resistance, but the Serbian engineers showed themselves at least their equals in such maneuvers. At one time they successfully mined over a hundred yards of Austrian trenches and blew 250 of its defenders into the air.

As for the Serbians, their attempts to break through the Austrian positions were fatally hampered by a shortage of ammunition. At one point they did, in fact, succeed in breaking through and then suddenly the ammunition supply came to an end and the Serbians had to retire again, leaving the Austrians to return to the trenches from which they had just been ejected.

Up in the northwest the Austrians also held a narrow strip of Serbian territory, along the Drina from Kuriachista up, but with this small exception they were confined to their side of the river until the triangular tract in the northeast of the Matchva Plain was reached, previously mentioned.

Along the Save from Parashnitzza to Shabatz they had also attempted a southward movement, where they were supported by five river monitors. During the period of comparatively little activity which now followed the Serbians were much worried by these monitors, which patrolled up and down the river at night, throwing their searchlights on and exposing the Serbian trenches. Then, too, they could hurl bombs into the Serbian positions with almost absolute impunity, for whenever the Serbian shells struck the heavy armor of these river fortresses they rolled off harmlessly.

On the night of October 22, 1914, the Serbians sent some mines floating down the river, one of which struck a monitor and, sank it in deep water.

For nearly six weeks through November, 1914, this deadlock continued. But during all this time, the Austrian General Staff was quietly preparing for another grand drive through Serbia.

It was then that the 150,000 reserve, previously mentioned, was assigned to General Potiorek's disposal, while his first line was also materially strengthened.

Nor did the third invasion begin with any dramatic effort. The pressure was applied gradually, little by little, until the Serbs were finally face to face with the necessity of shortening their lines, if they were not to be broken through. Other causes besides the increasing pressure from the Austrians contributed to the general causes.

Winter was coming on in earnest now. The low bottom lands in the Matchva plain were becoming waterlogged; it was impossible to keep the trenches from filling. The Serbians had, in the first place, made a mistake in attempting to hold these Matchva levels. On such battle grounds, the Magyars, from their own level plains, were too nearly their equals. On level ground, too, the defenders have less the advantage, unless they are in equal number, and the Serbians were everywhere in smaller number. This inferiority, too, made it less possible for the Serbian soldiers to obtain periods of rest away from the constant vigilance necessary in the first line trenches. The result was that they were under a more severe strain. They were subjected to all the drawbacks of trench warfare at its worst, without the respite that is usually accorded to men under these conditions on other fronts. The nerve-racking strain thus imposed became finally more than ordinary human beings could endure. Small wonder that the correspondents with the Serbian army reported many cases of insanity among the men in the trenches.

Finally the order came to withdraw from the Matchva Plain, to the foothills of the Tzer Mountains and the heights along the right bank of the Dobrava River. This retreat, made in the face of no specially strong attack, did not a little to depress the Serbian rank and file. It was beginning to feel that its strength was sapping away.

It was soon obvious that a more general retirement would now become necessary. Complete command of the Tzer Mountains could not be attained without the expenditure of more energy and ammunition than the Serbians could afford at this

time. So a general withdrawal was ordered, along the whole line. The Austrians, many of them fresh troops, unused to defeat, followed up in the footsteps of the retreating Serbians with enthusiastic vigor, from Shabatz to Liubovia. And presently Valievo, the railroad terminus and the first objective of the Austrians, became untenable.

On November 11, 1914, the Serbians were compelled to evacuate this city. Its capture was the first step in the progress of the Austrians toward Kragujevatz, Nish and a junction with the Turks near Constantinople. Still, as later events will show, the Serbians were by no means the beaten rabble described by the Vienna press. The score or more of cannon which the Serbians were compelled to abandon on account of the bad condition of the mountain roads were hailed as evidence of a hardly won campaign, the stragglers who were captured, were accepted as signs of a demoralization which had as yet not set in.

On the other hand, whether this first success was real or not, it did serve to inspire the Austrian troops with an enthusiasm which they had hitherto not possessed.

The Serbians had not yet been driven back on the line along which they had originally intended to make their first stand against the invaders. During the period between the first mobilization and the beginning of the first invasion on August 12, 1914, what are referred to as the Kolubara and Lyg positions had been strongly entrenched. But it had not proven necessary to fall back on these positions; the Austrians had been driven back at once. But now, after the fall of Valievo, the Serbians decided to make no further resistance to the Austrian advance until this line was reached.

The Kolubara River itself is not of sufficient width to hold back an advancing army long, but in places its banks rise so high and steeply that it serves very much the purpose of a moat before a castle wall. In such places a comparatively few men could hold back a large number of the enemy. A little south of Lazarevatz the line of intrenchments left the Kolubara and followed the Lyg River, where the country was even more rugged. From the source of the Lyg the Serbians had fortified the Jeljak

and Maljen ridges, which control practically all the roads leading to Kragujevatz and, proceeding in a southwesterly direction, they threw up earthworks on the Bukovi, Vardla, Jelova, Bukovic, Miloshevatz and Leska Gora ranges, which defended an advance toward the Western Morava Valley.

CHAPTER IV

PRELIMINARY AUSTRIAN SUCCESSES

IT was along this line that in November, 1914, the Serbians decided the decisive battle of the campaign should be fought. At Obrenovatz was stationed a strong brigade, known as the "Detachment of Obrenovatz." Further south, at Konatiche, on the Kolubara River, the cavalry division cooperated with the Second Army, which held the line from Volujak to Cooka and the ridges farther to the left. The Third Army occupied the right bank of the Lyg River from Barzilovitz to Ivanovchi. The First Army stretched itself out from Gukoshi to Ruda and along the Jeljak ridges to Maljen. And finally the "Army of Uzitsha," which had fought so brilliantly before in the southern section and penetrated into Bosnia, was assigned the protection of the base at Uzitsha and the Western Morava; it entrenched itself from a point southwest of Yasenovatz, through Prishedo, along the Jelova crests after which it crossed over to the heights of the Leska Gora to Shanatz.

This new line, much shorter than that previously held, enabled the Serbians to contract. Moreover, all the country was favorable to defense. Nowhere was it so screened that an approaching enemy could surprise them. Here, certainly, one defender was equal to two invaders.

Apparently the Austrian commanders realized that they had genuine obstacles to overcome, for they did not proceed with any impetuous haste. It was six weeks before they had advanced so far as to come into real contact with the new Serbian line.

During that interval they had been preparing for this kind of mountain warfare, by bringing up special mountain artillery and men who had had experience in just such a country, on the Italian front.

It was mid-November, 1914, before the Austrians were ready to deliver their first assaults. Almost every garrison in the town of Bosnia had been drawn on to swell their numbers and the troops brought up from the Italian front amounted to a whole army corps. All in all, there were about 250 battalions of infantry, in addition to cavalry, artillery and engineer corps.

One feature of this third invasion, which had not attended the first and second, was the vast number of refugees who now came fleeing through the Serbian lines. Their ox carts and their flocks blocked the roads, old men and women and children thronged the trails in their mad haste to get away from the advancing Austrians. Their reports of the vast numbers of the enemy that they had seen may not have helped to encourage the Serbian soldiers, but, on the other hand, they gave reports, somewhat exaggerated, perhaps, of such hideous atrocities committed by the Magyars that henceforth the Serbians were to fight with an added bitterness and hatred.

Allowing for a certain amount of exaggeration, there still seems to be solid foundation for the reports of atrocities committed by the Austrians in Serbia. But this seems to be a circumstance inseparable from any war. And, naturally, the invaders are necessarily always the guilty ones. The Serbians did not commit atrocities for the very simple reason that they never had the opportunity to come in among the enemy's villages. Had they invaded the Hungarian plains there would undoubtedly have been atrocities committed on both sides. An army like the Austrians, composed of so many different nationalities and races would naturally be more susceptible to such excesses.

Whatever their reasons for waiting so long before their next general attack, the Austrians had, at any rate, played into the hands of their enemy to the extent that they had allowed him

to accumulate a plentiful supply of ammunition. Moreover, more was coming, sent by the Allies and this had a cheering effect on the men.

On the morning of November 15, 1914, the Austrians began their first attack. It developed principally against the Second Army, south of Lazarevatz, and against the Uzitsha detachment in the direction of Kosjerichi. For five days the Austrians sent successive waves dashing against the Serbian walls, but each was repelled, hurled back, with comparatively little effort. How determined the Austrians were may be judged from the fact that the Serbians now took more prisoners than they had during all the previous operations.

Meanwhile the Austrians were also making a determined effort to take Belgrade; an effort, as will be described later, which was also to have an initial success. But, considering the unfamiliarity of even the best informed with the Serbian country, it will, perhaps, be wiser to take each theatre by itself. The operations before Belgrade, anyhow, were not closely connected with those in the interior of the country.

It seemed as though during those first five days of fighting the Austrians were merely testing the relative strength of the various sections of the Serbian line. On November 20, 1914, a powerful force of Austrians advanced and took possession of Milovatz, in close contact with the right flank of the First Army. Another column drove at its center at Ruda and successfully stormed the heights of Strazhara. The next day these movements developed into a mighty assault on the Serbian positions in this section. All day the Serbians held their ground, but toward evening the center weakened, then caved in, collapsed. The result was that the whole First Army was beaten back with heavy loss, until it was finally able to make another stand along the line from Babina Glava to Rajac.

The fire of the renewed attack flared up and down the front. The Third Army of the Serbians succeeded in holding its ground. Between the Uzitsha detachment and the Austrians the fighting was especially bloody, but neither side gained any distinct advantage.

But the retirement of the First Army from its strong position from Ruda to Gukoshi was disastrous, not only from a purely military aspect, but also in that it sent a wave of depression up and down the whole line of Serbians. This loss might be retrieved by an effective artillery support, but again the Serbians were feeling a shortage of ammunition. The Macedonians had finally succeeded in interrupting railroad traffic, and the supply of ammunition had been abruptly broken off.

Fortunately for the Serbians, the Austrians showed their usual disinclination of following up their success immediately. Their center rested while their mountain brigades delivered a rather feeble attack on the Serbian extreme left, on the line from Varda to Gruda.

It was November 24, 1914, before the Austrians came on in force again. This time the Second Serbian Army was forced back; to a line running from Galvitza to Smyrdlykovatz and the heights of Cooka were taken. The Uzitsha army was also forced to retire, on to the Goinjagora Mountains, at the head of the Western Morava Valley. The Austrians now also attempted to outflank the extreme left of the Serbian line. With this object in view they shot their mountain brigades down along their right, until the threatened Serbian flank was compelled to swing back to protect itself from an enveloping movement.

Finally, on November 28, 1914, the Uzitsha Army was able to make a determined stand along the heights from Kita to Markovitza.

In the south the Serbians had suffered a serious setback. Counterattacks were of little avail. How desperately the Serbians resisted may be judged from the fact during one of their counterattacks, made at Salinatz, they took prisoner seven officers and 1,580 men. In general, however, they were forced back, step by step. One by one, each succeeding ridge fell into the hands of the invaders. And finally the dominating ridges of the Suvobor Mountains were in complete possession of the Austrians.

In the north the Serbians had made a better showing. Along the Kolubara River the fighting had been especially heavy. One Aus-

trian division had even succeeded in penetrating as far as Progon, on November 24, 1914, but it was finally driven back by the cavalry division with heavy loss.

The result of this stage of the fighting was that the Serbians had again been compelled to lengthen their lines; their front now extended from Tchatchak to Belgrade, almost seventy miles.

CHAPTER LVI

CRISIS OF THE CAMPAIGN—AUSTRIAN DEFEAT

WE have now arrived at the critical point, not only of the third Austrian invasion, but of all the military operations in the Serbian theatre. If the Austrians should now again be driven back, it would be practically impossible for them to make another invasion unaided, at least so long as they were engaged with Russia. And, on the other hand, if the Serbians lost now, the whole country was lost. The climax was at hand. For this reason it may be well to define again the position and the strength of the two opposing lines.

On November 28, 1914, the Serbian units were disposed as follows: The Second Army, from Vechani to Vagan; the Third Army, from Kalanjevchi to Kelja; the First Army, from Silopaj to Galich; the Uzitsha Army, from Kita to Markovitza.

The Austrians had four mountain brigades in the direction of the Western Morava Valley; about one and a half army corps on the road along Valievo to Milanovatz; an entire corps against Lazarevatz and two corps moving eastward against the Serbian line from Belgrade to Mladenovatz.

On the night of November 29, 1914, to shorten this long line the Serbians decided to withdraw from Belgrade. A redistribution of the Serbian forces was then made as follows: the troops from the Kolubara retired to the heights about Sibnitza and the Belgrade detachment was thrown astride the Belgrade-Nish Rail-

road along the summits of Varoonitza in the east and Kosmai in the west. Elsewhere the positions remained practically the same as before. Apparently General Putnik felt that the retreat of the First Army, which had caused the general retirement of the Serbian front, had not been absolutely necessary, for the commander of that force was now relieved and in his place was appointed General Mishitch, a member of the General Staff. How wise this change was may be judged from the later behavior of the First Army, which was destined yet to retrieve itself.

To the trained military observer, the strategy of the Austrians would by this time have become apparent. With the Suvobor Mountains as a central pivot, they had strengthened their wings and attempted to swing around in the north by Mladenovatz and south down the Western Morava Valley. Had this movement been safely accomplished the mass of the Serbian army, together with their arsenal at Kragujevatz, would have been rounded up, after which the new Serbian capital, Nish, would have followed easily and Serbia would have been completely in Austrian hands.

On December 2, 1914, this was the plan which the Austrians were putting into execution, in rather a leisurely way, when the Serbians, having drawn in their breath for a final effort, began their great counterattack. Nor can there be any doubt that the Austrians were completely surprised by this sudden renewal of the Serbian strength. It is only necessary to read the press dispatches from Vienna, issued during the few days previous, to be convinced that General Potiorek had reported the Serbians as completely defeated. Not only the Austrians, but the whole world was surprised by the startling change that now took place in the Serbian theatre.

Under the command of General Mishitch, the First Army hurled itself against Suvobor and, after a bloody three days' struggle, took the heights and pushed in the Austrian center, driving its forces in this section in a disorganized flight toward Valievo. The days that ended the first invasion were renewed. Nor was this flight a mere sudden panic; it had, in fact, risen in a crescendo, from a small beginning, until it developed into a veritable débâcle.

At first the Austrians had attempted an orderly withdrawal, as testified by their effort to take with them all their heavy artillery. The scene that occurred near Gorni Toplitzza will serve to illustrate the whole retreat. Here, where the road winds around a commanding bluff, which overlooks a valley, the Austrians had planted a battery of field guns, right on the edge of the cliff. In the road leading up to this height were placed a score of ammunition wagons from which little two-wheeled carts were employed to carry the ammunition up to the guns. Deployed on the flank of this position, the Serbian gunners had suddenly covered it with a terrible enfilading fire and men, horses, carts, and wagons lay in a mangled heap. There were dead horses in the shafts of the carts, whose bridles were still clutched by the hands of dead men. Some few had tried to escape the avalanche of flying steel and as they ran they hurled from them caps, ammunition, haversacks and rifles only to be raked down before they could reach the shelter of a neighboring ravine. And this was merely one little corner of the general scene. All along the road to Valievo the ground was strewn with material, even to the rations of the soldiers, jolted out of the knapsacks as they were cast down by their fleeing owners.

During that first day of fighting the First Army captured twelve officers, 1,500 men, five mountain howitzers and four machine guns, then advanced, until by nightfall it was able to take up a position along a line from Kostuniche to Vranovicha. During this time the Uzitsha Army was fiercely attacked in its position on both sides of the Western Morava Valley, but it succeeded in driving back the assaults. The Third Army had also advanced slowly toward Lipet, taking over 500 prisoners and two machine guns. The Second Army met desperate opposition, but finally began surging ahead and soon sent in its share of captured war material and prisoners.

In the north an important force of the Austrians was making toward Belgrade, to lead a triumphal entry. Reconnoitering parties, sent out from the flank of this body, were seen in the direction of Slatina and Popovitch.

The decided successes of this first day's fighting acted

as a powerful stimulant on the previously depressed Serbian rank and file, though they still realized that there was many a hard fought attack to be driven into the vitals of the ponderous body of the enemy before he could be finally hurled back across the frontier. The Austrians still remained in possession of mountain positions of great natural strength, which could only be taken at the point of the bayonet. But the Serbians had recovered their *morale*; again they were fighting with that energy and vigor which had characterized their assaults during the first and second invasions. And they were amply rewarded.

By December 5, 1914, the First Army had retaken the dominating heights of the Suvobor Mountains and the summit of Rajatz. The Third Army, after buckling back a stubborn resistance, advanced as far as Vrlaja during the day. During that same night the Austrians were driven from Lipet, leaving 2,000 of their own number behind as prisoners. The Second Army, on its part, had pushed steadily on and by night it reached Kremenitza and Barosnevatz. The Uzitsha Army, opposed by greater numbers, was unable to participate in the general forward movement, but, on the other hand, it held its own during the day's fighting. During that night it hurled itself at the enemy, and by morning he was retreating toward Zelenibreg.

There was now no longer any doubt that the chances of success for this third invasion of Serbia were beginning to assume very slender proportions. The three army corps in the Austrian center and right had been completely broken and were now retreating in mad, disorganized flight toward Valievo and Rogatitza. Even should the Serbians fail to follow up this section of the enemy's forces with full vigor; even should it have a few days for reforming, the loss of so much war material made such a possibility very difficult. There would hardly be time, under any circumstance, to draw fresh supplies from over the frontier before the Serbians could come up with them.

On December 7, 1914, the Uzitsha Army reached Pošega. The First Army, after storming and taking the heights of Maljen, advanced and formed a line between Maljen and Toplitza. The

Third Army made a strong push forward and reached the line from Milovatz to Dubovitzza, making a great haul of guns and prisoners. Only the Second Army failed to make any headway. Obviously, the Austrian field commander realized that the situation in the center was lost; this would account for his attempted diversion in the north. Here two Austrian corps held their ground successfully and they not only were able to check the advance of the Second Army, but they advanced to an attack against the Detachment of Belgrade at Kosmai and Varoonitzza.

On the whole, however, the fortunes of war had, during that day, rested decidedly with the Serbians. They had captured 29 officers, 6,472 men, 27 field guns, 1 mountain gun, 15 gun carriages, 56 wagons loaded with artillery ammunition and between 500 and 600 ordinary transport wagons. Above all, the situation in the south, where it had at first seemed most hopeless, was now retrieved beyond question and the Austrians in that section were fleeing helter-skelter before a lively Serbian advance, led by the Serbian Generals Sturm and Mishitch.

The next day, December 8, 1914, began with hard fighting around Uzitsha, but the division here (the Uzitsha detachment), was not to be pressed back on its very own home soil; the Austrian lines wavered, broke, then scattered, the soldiers fleeing for the frontier. The First Army continued triumphantly, as it had done the day before, advancing and sweeping all in its way before it. It ended the day by storming and entering Valievo.

The Austrians holding Valievo had carefully prepared for its defense, for this town they were reluctant to give up. The approach by the main road had been heavily intrenched and the guns were in position. But the main force of the Serbians circled around in the hills and flanked the position of the Austrians, taking them completely by surprise. They broke and ran, and while the fugitives hurried off toward Loznitzza and Shabatz, a rear guard of Hungarians on the hills to the northwest put up a rather indifferent fight before they, too, fled in mad disorder. The last of them were caught by the Serbian artillery and, while running over a stretch of rising ground, over a hundred were shot to pieces by shrapnel. When the Serbians arrived the ground was

literally covered with mangled forms; here and there sat a few wounded.

The Third Army likewise shared in the general triumph. It reached the Kolubara, at its junction with the Lyg. Throwing out one of its divisions eastward, it threatened the right flank of the enemy on Cooka, then permitted the Second Army to carry that position. By this movement the Serbians succeeded in driving in a wedge and completely cut off the three beaten and fleeing corps in the south from the two in the north, which were still showing some disposition to hold their ground.

The operations in the west and northwest now resolved themselves into a wild, scrambling foot race for the frontier. The worst of the fighting was now over; indeed, the Austrians now fought only when cornered. Most of them were by this time unarmed, thinking of nothing but how to reach the frontier before the first of the pursuing Serbians.

The terminology of military science cannot, indeed, paint such a picture as was now spread over the land of Serbia. Wounded warriors, now resolving themselves into helpless, suffering peasants, simple tillers of the soil, save for the tatters of their blue and gray uniforms which alone indicated what they had been, lay by the roadsides and along mountain trails, abandoned by their comrades. Others lay mangled, their forms beaten out of all recognition. Scattered over all, wherever road or trail passed, lay guns and cartridges, sometimes in heaps, where they had been dumped out of the fleeing wagons. And further on lay the wagons themselves, some thrown over on their sides, where the drivers had cut the traces and continued their flight on the backs of their horses.

Later in the day, December 8, 1914, the scenes along the highways took on a different character. The main columns of the pursuing Serbians had passed on, but straggling files of those too tired or too weak to be in the fore of the chase still continued onward. More slowly followed a steady stream of returning refugees, their oxen, in various stages of life and death, yoked up to every conceivable manner of springless vehicle, piled high with odds and ends of furniture and bedding which had been snatched

up in the mad hurry of flight. On top of the bundles lay sick and starving children, wan with want and exposure. Beside the wagon walked weary women or old men, urging their animals on with weird cries and curses, returning to the devastated remains of what had once been their homes.

Later still, from opposite directions, came processions of Austrian prisoners, sometimes thousands of them, guarded by a handful of Third Ban Serbian soldiers, still wearing their peasant costumes. Among the prisoners were smooth-faced youths and old men, some in the uniforms of soldiers, or of Landwehr, or Landsturm. All types of that hodge-podge of nationalities and races which the flag of Austria-Hungary represents were there; Germans, Magyars, Croats, Czechs, Moravians, Slovaks, Rumanians, Lithuanians, and Bosnian Musselmans.

In between the convoys straggled men of the Serbian Army who had fallen out of the chase by the way, most of them Third Ban men, too advanced in years to keep up the pace set by the younger men. Nowhere moved anything but suffering, bleeding humanity.

On this scene the sun, a glowing disc of copper, finally set, and the struggling figures merged into the deepening dusk, and presently only black, halting shadows were creeping along the dark trails and roads.

CHAPTER LVII

THE FATE OF BELGRADE

DURING all this time a separate drama was being enacted in and around Belgrade, the Serbian capital. Unfortified and not especially adapted for defense, except for the breadth of the Danube flowing along its low front, it was the cause of a general, world-wide wonder that it should not have fallen almost immediately into Austrian hands. Quite aside from military values, the capture of an enemy's capital always makes a strong, moral impression, on both sides.

Beginning with the early morning of July 29, 1914, when a detachment of Serbian irregulars beat off a river steamer and two troop laden barges which were attempting to approach the shore just below Belgrade, there followed a period during which the citizens of the city had their full share in experiencing the horrors of warfare. The booming of heavy siege artillery and the screaming of shells at first startled them, then became so commonplace as barely to attract their attention. The attacks and counterattacks on mid-river islands became incidents of daily occurrence. Ruined buildings, wrecked houses and dead bodies in the streets became an unmarked portion of their everyday life.

For the greater part of this period Austrian cannon, planted across the river, poured shell, shrapnel, and incendiary bombs into the city, with intent to batter down its modern buildings and to terrorize the inhabitants. Over 700 buildings were struck by bombs, shells, or shrapnel, and of these sixty were the property of the State, including the University, the Museum, foreign legations, hospitals, and factories. The foundries, bakeries and all the factories along the Serbian shore of the river were razed to the ground. Austrian howitzer shells dropped through the roof of the king's palace and wrecked all of the gorgeous interior. The University was riddled until the building, with its classrooms, laboratories, library, and workshops, was entirely demolished. Even the cellars were destroyed by great shells, which broke down the walls, pierced their way into the very bowels of the earth and there exploded. As the result of a steady fire to destroy the state bank, one street, running up from the water's edge, was ripped up from curb to curb. Missiles pierced the wood paving and its concrete foundations by small holes, passed along underground for some distance, then exploded, throwing particles of the roadway to all sides.

Many of these shells were fired from the Austrian batteries stationed over near Semlin, but presently there also appeared a fleet of river monitors, so heavily armored that no Serbian shell could pierce their sides. These would parade up and down the

river channel with impunity, adding their share to the general destruction.

Finally, in the beginning of November, 1914, there arrived in Belgrade two big 14-centimeter cannon, sent by the French Government by way of the Adriatic, together with French gunners and 20,000 rounds of ammunition. These were put into position above the city and on November 8, 1914, the French gunners sent their first message over into Hungary. The damage inflicted so impressed the monitors that they did not again venture into range. Moreover, spies, of whom there were probably a number in Belgrade, had doubtless notified the Austrians that measures were now being taken to mine the river effectively. In fact, many measures for a more effective offensive were being undertaken when the trend of operations in the interior forced the Serbian General Staff to order the evacuation of the capital.

It will be remembered that the Serbians had been beaten back from their main line of defense and that a rearrangement of the Serbian forces had thereby become necessary, in order that the line might be shortened.

This included the abandonment of Belgrade on November 29, 1914. The order was carried out during the night. But before retiring, the French gunners, who saw that they were going to lose their two big guns, determined to bid the enemy across the river a hearty good-by. In the early morning they fired off their stock of 240 rounds of ammunition and in a little more than half an hour deposited some twelve tons of melinite on the enemy's forts at Bezania, with such terrifying effect that the garrison abandoned it. Thus it came to pass that the two strongholds, having snarled and barked at each other across the dividing waters for nearly five months, were both evacuated at the same time.

As will be remembered, the right wing of the Serbian lines, now joined by the garrison of Belgrade, swung back and stretched across the Belgrade-Nish railroad, along the ridges of Varoonitza in the east and Kosmai in the west. The Austrian left, composed of two army corps, immediately covered the ceded territory and, of course, entered Belgrade. Then followed the strong

Serbian counterattack against the Austrian center along the Suvobor ridges and the complete demoralization of the Austrian forces from the center south.

The northern wing of the Austrians, however, which held the country around Belgrade succeeded in holding its own, though it was presently cut off from the rest of the Austrian forces. But this was all according to the plans of General Putnik. Being much outnumbered he could not spare the forces necessary to rout the enemy's strong northern force. Having broken the center of Potiorek's front, the Serbian commander gave his chief attention to capturing the Austrian southern wing, operating in the Western Morava Valley.

On December 8 and 9, 1914, the Serbian right wing had been hard pressed along the line from Kosmai to Varoonitza, but the completeness of the Austrian defeat in the other theatres enabled General Putnik to rearrange his troops. He therefore dispatched the left wing of the Third Army against Obrenovatz, attached the rest of the Third Army and the cavalry division to the Second Army and placed this new combination of forces, together with the garrison of Belgrade, under the command of Voivode Stepanovitch, he who had made so brilliant a record at the first battle on the Tzer ridges.

CHAPTER LVIII

ATTEMPTS TO RETAKE BELGRADE

ON December 10, 1914, General Stepanovitch immediately began a movement against Belgrade which had now been in the hands of the Austrians since the first of the month. At this time the Third Army was pressing on toward Obrenovatz, the cavalry division held the left bank of the Beljanitza River, the Second Army was holding a line from Volujak to Neminikuchir, the Belgrade detachment still maintained the ridges along Kosmai and Varoonitza and a detachment, which had come up from Semendria, occupied Pudarchi. The troops thus formed a crescent, with

one horn touching the Save and the other the Danube, Belgrade being the star in the middle.

The Austrian main positions stretched from Obrenovatz up the right bank of the Kolubara to Konatitche and then across to Grooka through Boran, Vlashko and Krajкова Bara.

There now followed what was probably the most stubborn fighting of the third invasion: either the Austrian soldiers composing this northern army were better material, or the Austrian commanders were especially animated with the necessity of holding Belgrade.

On the morning of December 11, 1914, the Serbian advance began. As possession of the railroad was of first importance, the center pushed rapidly ahead until it reached Vlashko heights. Again and again the Serbians charged up the slopes of this eminence, only to be beaten back. But finally, toward evening, the Austrians fell back and the summit was taken, thereby giving the Serbians control of the railroad at Ralia; the terminus of the line, in fact, for a tunnel several miles farther north had been blown up by the Serbians on the day they had evacuated Belgrade.

Early the next day, December 12, 1914, the advance was continued and the left wing of the Third Army reached Obrenovatz and its right occupied a line from Konatitche to Boshdarevatz. The Second Army occupied the summits designated as Hills 418 and 287 and the Belgrade detachment advanced to a front from Koviona to Krajкова Bara.

Thus, with astonishing swiftness, and in spite of the stubborn resistance, the crescent was contracting and the Austrians were being squeezed back into Belgrade. But they continued their desperate resistance, fighting over every foot of ground before surrendering it. By December 13, 1914, the enemy had been routed from all the territory lying between the Save and the Drina, but with such desperation did the Austrians cling to Belgrade that they delivered repeated counterattacks upon the Serbian positions at Koviona and Krajково Bara before they finally retired north.

The triumphant Serbians, though they had suffered severely, followed up the retreat vigorously, pressing along the banks of

the Topchiderska River on the left and up the main road on the right. The left wing, had advanced up the Kolubara River toward its junction with the Save, which was eight miles behind the Austrian front. The enemy had to draw back, for fear of being suddenly taken in the rear. Two monitors were sent up the river to check the Serbian cavalry division, which was trying to work its way around the marshes and thus cut off the Austrian force entirely. But this movement of the left wing was merely a feint; it was intended simply to make the Austrian line waver. While the Austrians were maneuvering in answer to this feint, the Serbian center was pushing its advance.

The Austrians had attempted to check the Serbian advance by intrenching heavy rear-guard forces in several strong positions, the nature of the country being especially suited to such tactics. The hills along the road north of Ralia are, indeed, strategic points of immense military value. But the Serbians, their capital now almost in view, pressed on with frantic vigor.

The Austrians fought manfully, giving them one of the best fights they had yet been through. Instead of merely clinging to their hill intrenchments, they made fierce and determined efforts to pierce the Serbian line. It was in one of these counterattacks, near the central height, where the railroad entered a tunnel, that the resistance of the Austrians was broken. After the Serbian riflemen, with their machine guns, had thrown back the enemy, the Serbian artillery caught the retiring masses of blue and gray clad soldiers of the Dual Empire.

This produced a panic in the densely packed retreating column, whereupon the Serbian infantrymen leaped out of their trenches and dashed forward in pursuit, forming two pursuing columns, one on either flank of the fleeing Austrians, like wolves worrying a wounded buffalo. And as these streams of Serbians ran uphill more rapidly than the blue-gray flood moved, the Austrian rear guards, composed of heavy forces, turned to check the pursuit.

On the morning of December 14, 1914, the Serbians approached the southern defenses of Belgrade, where the Austrians must make their last stand; along a line from Ekmekluk to Bano-

vobrodo. Here General Potiorek had constructed a system of earthworks, consisting of deep trenches with shrapnel cover and well-concealed gun positions, with numerous heavy howitzers and field pieces. Evidently he hoped to withstand an indefinite siege on this fragment of Serbian territory, holding Belgrade as a bridgehead for another advance toward the main Morava valley, when the next effort to invade Serbia should be made. He would, at the same time, preserve at least a semblance of his prestige from all the calamities that had befallen his armies, enabling him to represent the campaign as a reconnaissance in force, similar to Hindenburg's first advance against Warsaw.

But his troops had been so terribly punished that they could not garrison the siege defenses. The Serbians, now drunk with their many victories, and absolutely reckless of death, as they drove on toward their capital, with their old king, grandson of Black George, moving through their foremost ranks, charged up into the ring of hills.

The last fight, on December 14, 1914, which definitely broke the back of the last effort of the Austrians to maintain a footing on Serbian soil, took place on the central height, Torlak. Two battalions of Magyars were defending this point. And just as the sun was setting over in the Matchva swamps in a glow of fiery clouds, the foremost Serbians leaped up to the attack.

Long before the fight was over, dark set in. The Serbians, driven back again and again, came back like bounding rubber balls. Finally they gained the trenches, and one general, horrible mêlée of struggling, shouting, furious combatants set in. The shooting had died down; they were fighting with bayonets and knives now. Finally the tumult died down. But nearly every Austrian on that height died. Few escaped and not very many were taken prisoners. Then, under cover of the night, the Serbians spread over the other heights and captured the whole line of defense works.

No Serbian slept that night. They tugged and dragged at their heavy guns through all the dark hours, up toward the city, and placed them on heights commanding the pontoon bridges that had been thrown over the Save from Semlin.

When dawn broke on December 15, 1914, a heavy mist hung over the river, but the Serbians knew with accuracy the location of the pontoon bridge. All during the previous day and during the night the retreating Austrians had been crowding over this bridge to escape into Austrian territory. At first the retirement had been orderly, but later in the day, as the news from the front became more serious, as the low, distant roar of rifle and machine gun rolled nearer, the movement increased in intensity, and, during the night, developed into a hurried scamper. Cannon were unlimbered and thrown into the river, and troops fought among themselves over the right of way along the narrow plank walk. In the midst of this confusion, while yet thousands of the invaders were still on the Serbian side of the river, just as dawn was breaking, there came a deep report, the hissing of a flying steel missile, and a shell dropped in the middle of one of the pontoon supports, hurling timber and human beings up into the air. The confusion now became a wild panic. Some tried to return to the Serbian shore, others fought on. Dozens of the struggling figures rolled over the side of the bridge into the eddying currents of the waters.

Again came the dull, heavy report, then another and another, followed by the screeching overhead. Shells dropped into the water on all sides. And then another bomb burst, on the pontoon where the first shell had landed.

Even the roar of the shouting soldiers could not be heard above the crashing of timbers, the snapping of mooring chains. The bridge swayed, then caved in, where the pontoon had been struck and was sinking. Between the two broken-off ends, still crowded with struggling humanity, rushed the turbid current of the river. The last road to safety had been cut.

Presently the fog lifted and revealed a long line of retreating Austrians, reaching down the road toward Obrenovatz, still heading desperately for the bridge, as unconscious of its destruction as a line of ants whose hill has been trampled in by a cow's hoof. But they were not long to remain unconscious of the fact that they were now prisoners of war.

CHAPTER LIX

SERBIANS RETAKE THE CITY—END OF
THIRD INVASION

AS the sun rose on December 15, 1914, the Serbian cavalry, accompanied by King Peter, swept down from the heights of Torlak and entered the streets of the capital. A volley from the remnant of a Hungarian regiment met them. The cavalymen dismounted and began driving the Magyars down the streets, from one square to another. And while this fight, an armed riot, rather than a military action, was going on, finally to end in the practical slaughter of all the Hungarians, who would not surrender, the king entered the cathedral of his capital to celebrate a mass of thanksgiving for the deliverance of his kingdom from the hands of the enemy. And even as the mass ended, stray shots echoed through the streets of the city still.

Two hours later the Crown Prince, Alexander, accompanied by his brother, Prince George, a strong cavalry escort, and the British military attaché, approached Belgrade. They were met on the outskirts by a crowd of women and children who, with a few exceptions, were all of the inhabitants that remained, the Austrians having carried the others off with them the day before. They had collected masses of flowers, and with these they bombarded and decorated the incoming soldiers. The girls brought the embroidered scarves and sashes, which they had worked in preparation for marriage, and these they hung about the cavalymen's necks until they looked as though they were celebrating at a village wedding. Huge tricolor streamers now hung from the houses and buildings, while bits of dirty bunting fluttered from the cottages.

In the streets of Belgrade the Austrians left 5 cannon, 8 ammunition wagons, 440 transport wagons, and 1,000 horses. Some 150 junior officers and 10,000 men also found their retreat suddenly cut off; among them were few officers of high rank. In one of the officers' headquarters the evening meal

was still spread on the table, the soup half consumed, the wine half drunk.

So ended the third Austrian invasion of Serbia. Of the army of 300,000 men who had crossed the Drina and Save rivers, not over 200,000 returned. During the last thirteen days of the operations the Serbians had captured 41,538 prisoners, including 323 officers, and enormous quantities of war material; 133 cannon, 71 machine guns, 29 gun carriages, 386 ammunition wagons, 45 portable ovens, 3,350 transport wagons, 2,243 horses, and 1,078 oxen. The Austrian killed and wounded numbered not far from 60,000.

The Austrian occupation of Belgrade had lasted just fourteen days. The invaders had evidently not counted on the disaster that was so soon to come to them. Under the guidance of their late military attaché in Serbia, they had established themselves in the best available buildings, began to repair the streets, which they themselves had ripped open by shell fire, and set up the semblance of a city administration. But it was still evident that no central authority from above had as yet been able to assert itself. The personality of each commander was represented by the marks left behind in his district. The buildings occupied by one military authority remained cleanly and intact, even the king's photograph being left undamaged. In others, furniture was destroyed and the royal image shot and slashed to pieces. Entire sections of the town escaped pillage. Other quarters were plundered from end to end. While the cathedral and other churches were not seriously damaged, the General Post Office was completely wrecked. The furniture in the Sobranje, the house of the national assembly, was destroyed and broken, and the Royal Palace was stripped from floor to ceiling, the contents being carted off to Hungary in furniture vans, brought especially from Semlin for that purpose.

With the army of occupation came 800 wounded soldiers, from the other theatres of operations. Most of them were immediately turned over to the American Red Cross unit established in Belgrade, already caring for 1,200 wounded Serbians. As the fighting continued in the interior these numbers were constantly

augmented, until the American hospital sheltered nearly 3,000 wounded men.

When the evacuation began the Austrians left their own wounded, but took with them the Serbian patients, to swell the number of their prisoners of war. Several hundred of the non-combatant citizens were also taken into captivity.

In the importance of its influence on the war as a whole, the achievement of the Serbians in repelling the three Austrian invasions will probably be found, when the complete history of the war is finally written, to take very high rank. For had Serbia fallen, the Teutonic Empires would have been united with little delay to their Turkish allies. Austria might then have been able to hold off the Russians by herself, while the Germans would thereby have been so much stronger for pressing their campaigns in Belgium and East Prussia, with what results, can only be guessed. The Austrians themselves were astounded by the extraordinary power of little Serbia. Their last disaster, indeed, so roused their anger that they began preparing again for another attempt to conquer this stubborn little nation.

Calling the Germans to their aid, they began in January, 1915, to collect a new army, 400,000 strong, which was ranged along the Serbian frontier. But the pressure from the Russians, on the Carpathian front, presently became so heavy that this body of troops was needed there, and so Serbia was left in peace for the time being.

Thenceforward, only insignificant fighting took place between the belligerents on each side of the rivers, such fighting being mostly in the nature of artillery actions. Belgrade was not again, during that period, at least, subjected to bombardment. An arrangement was made between the Serbian and Austrian commanders whereby the Serbians refrained from firing on Semlin, and the Austrians spared Belgrade.

There was, however, some activity on the river itself. Belgrade was now garrisoned by a mixed force of Serbians, British, and French, the British being mostly gunners, who had been detached, together with some big naval guns, from the British navy. For some time before they arrived the Austrian monitors and picket

boats had again been patrolling the Danube and annoying the Serbians, but the Belgrade garrison put an end to the activities of these vessels with their big guns. The British sailors especially rendered good service by means of a small picket boat, commanded by Lieutenant Commander Kerr. Though armed with only a single machine gun, this small boat was so persistently troublesome to the enemy that it earned for itself the name "Terror of the Danube." Of dark nights it would poke its way into creeks and passages, alarming the Austrians constantly and causing them no little loss. Once it even succeeded in persuading one of the monitors to pursue it into a carefully prepared mine field, over against the Serbian shore, with the result that the monitor was permanently put out of action. But these operations were of minor importance just then. For now Serbia was called on to face a new enemy, in some of its aspects much more terrible than the Austrians, for it demanded a sort of fighting in which the Serbians were not so well trained. The Austrians had, indeed, left behind them an ally that was to accomplish as much mischief almost as they themselves had caused the Serbians.

Not long after the final defeat of the third invasion an epidemic of typhus appeared among the Serbian soldiers. Run down physically, as they must have been, their vitality sapped by the hardships of the campaigns they had just passed through, they fell victims to this scourge by the thousands. Not knowing how to attack or to defend itself against such an enemy, the little kingdom sent forth a cry for help, which was heard and responded to by the United States, Great Britain, France, and even Russia. Organizations were formed with the purpose of assisting Serbia in this extremity, and private persons also came forward with offers of money and service. The Red Cross also did what it could under the emergency, but its resources were already being taxed to their full extent by demands in all the battle fields of Europe. Sir Thomas Lipton sailed his yacht, the *Erin*, to Saloniki, loaded with supplies of medical stores, and carrying a full passenger list of doctors and nurses. Lady Paget, Lady Wimborne, and other women of rank in Great Britain also devoted their whole energies to the cause. A society of women physicians,

an offspring of the Scottish Federation of the National Union of Women's Suffrage Societies, did noble work in Serbia. After sending two hospital units to France, this women's organization dispatched a third to the Balkans, where it was received with the deepest gratitude, Serbia agreeing with enthusiasm to pay the salaries of its members and the cost of its maintenance. It was stationed at Kragujevatz, where it was given a hospital of 250 beds.

But meanwhile the epidemic had spread over the country. There were thousands of serious cases; men, women, and children were dying everywhere, unattended and under the most distressing circumstances. Hardly had the first of the foreign aid arrived when the immensity of the task required was recognized, and telegrams and cables were sent all over the world calling for further assistance. To this second appeal no country responded more nobly than the United States.

Owing to the virulent character of the disease that raged in every district, the mortality was frightful. In many localities the death rate was over 50 per cent. All during the spring and summer of 1915, the need of Serbia was extreme. In July there were in the country 420 British doctors alone, aside from the French, Russian and American medical men, all working at the highest pressure and doing with very little sleep, yet unable to cover the ground. Many were the stricken patients who must be satisfied with floors instead of beds; many more who could not even be admitted into the hospitals. Nor were the Serbians the only sufferers; from among the foreigners who had so nobly come to help the Serbians in their distress, there were not a few who succumbed to the fatal disease.

CHAPTER LX

MONTENEGRO IN THE WAR

THE military operations on the Montenegrin front should really be considered as a part, though a detached part, of the Serbian campaigns. Up to the first Balkan War Serbia and Montenegro, or Tzernagora, as it is called by its own people, were separated by the Sandjak of Novibazar, a territory which Turkey was allowed to retain after the Treaty of Berlin at the instigation of Austria, so that the two countries should have no opportunity to unite. By blood the two peoples are closely akin, though the isolation of the Montenegrins has been the cause of their not adopting so many of the outward tokens of civilization as the Serbians.

Already on July 25, 1913, before Austria had officially declared war against Serbia, the Montenegrin Government, at the capital, Cetinje, announced that it would support Serbia should there be an outbreak of hostilities with their common hereditary enemy, Austria. Montenegro had, indeed, even more reason than Serbia for hating the great empire to the northward, for its territory stretched down the coast, from Dalmatia, and literally fenced her in from the Adriatic, whose blue waters are visible from the Montenegrin towns and villages perched up on the mountains above the shore. In the Balkan war the army of Montenegro had captured, at a terrible sacrifice of blood, the town of Scutari from the Turks, which dominates the only fertile section among the crags of the little mountain kingdom. It was Austria, at the London Conference, who had forced her to relinquish this dearly paid for prize, though so reluctantly was it given up that the Powers were on the point of intervening.

The value of the Montenegrin army in such a great war as was now begun was slight, however, for in numbers it did not amount even to a full army corps. Nor would it be very efficient outside of its own territory, for the Montenegrins, whose manner of life is quite as primitive as that of the Albanians, are

essentially guerrilla fighters, who cannot well adapt themselves to army discipline.

On a war footing the army is composed of four divisions, the first three of three brigades each, while one is composed only of two brigades. Altogether there are fifty-five battalions, or about 40,000 men. Each brigade also includes one detachment of mounted scouts, one mountain battery, one group of rapid-fire guns, one section of telegraphists and one section of engineers. Each division has, in addition, attached to it a detachment of mounted scouts, a section of engineers, a field battery and a heavy battery. Then there is a reserve of eleven battalions, usually assigned to garrison or guard duty. Altogether the total armament amounts to 40,000 rifles, 104 guns and forty-four mitrailleuses.

Of the actual operations along the Montenegrin front not so much detailed information is available as there is of the other sections of the theatre of war. War correspondents were not allowed to accompany either army in this field and the only reports so far given out, covering this period, are from the few official bulletins issued by the two respective governments and from other more indirect sources.

On August 3, when the Austrians had already begun bombarding Belgrade, King Nicholas signed an order for the mobilization of his forces, and four days later, on August 7, he declared war against Austria. But already the Austrians had detached an army corps under General Ermaly to prevent any possible juncture between the Serbian and Montenegrin forces. For the time being, therefore, until the Serbians had driven back the first Austrian invasion, the Montenegrins facing this division of the Austrian army acted on the defensive.

This, however, with the advantageous nature of the country, did not require the full strength of the Montenegrin army; part of it, therefore, was employed in an attack on the Austrian towns situated on the narrow strip of Austrian territory running along the sea coast. The chief of these, Cattaro, was subjected to a hot bombardment from the heavy guns on Mt. Lovcen, commanding that section of the coast. A few days later, on August

10, the Montenegrin infantry descended from the surrounding heights and delivered a strong assault on Spizza and Budua. The activity of Austrian warships, which bombarded Antivari, where Montenegro touched the coast, made it impossible for the Montenegrins to hold what they had taken. Another force, however, turned toward Scutari and occupied that town. Mt. Lovcen continued, not only then, but at intervals for the next year, to pour a heavy artillery fire on Cattaro, and its environs.

In Bosnia, over toward the Serbian operations, fighting had already begun and continued until the Serbians drove the main Austrian army back. On August 20, just as the Serbians were delivering their last attack on Shabatz and the Austrians were stampeding across the Drina, the Montenegrins delivered a heavy attack along their whole front, causing the Austrians to retire in that section as well. The following day the Austrians, in trying to recover their lost ground, brought up more mountain artillery, then advanced their infantry up against the Montenegrin entrenchments. Here occurred the first hand-to-hand fighting, the Austrians charging with their bayonets again and again, but they were finally repulsed again with heavy loss.

From now on the Montenegrins, under the command of General Vukotitch, who had so distinguished himself in the Balkan War, gradually assumed an offensive and advanced into Bosnia. On September 2 he again encountered the Austrians at Bilek, and succeeded in defeating them after a heavy fight, in which a comparatively large number of prisoners were taken.

The Montenegrins, comprising practically all of their army, continued advancing in three columns. On September 9 there was another hot fight at Foca, south of Sarajevo.

At this juncture the Serbians sent a column into Bosnia, from Visegrad, whose purpose was to effect a connection with General Vukotitch, that the two combined forces might advance on and take Sarajevo, a movement which was to be carried on simultaneously with the Serbian advance into Austrian territory from the Save.

But, although the two allied armies almost reached the vicinity of the Bosnian capital, the Austrians were now, toward the latter

part of September, returning to this region in great force, to begin the second invasion of Serbia. The Montenegrin army was, in consequence, obliged to retire before vastly superior forces and, during the rest of the year, as did the Serbians, the Montenegrins were satisfied merely with keeping the enemy out of their home territory. What fighting occurred after that moment was of more or less a desultory nature and entirely defensive.

PART V—AUSTRO-RUSSIAN CAMPAIGN

CHAPTER LXI

STRENGTH AND EQUIPMENT OF THE ANTAGONISTS

THE first campaign between the Austrian army and the Russian legions began on August 6, 1914, when Austria declared war on Russia. We have witnessed in the preceding chapters the German invasion of Belgium and France, and the Austrian invasion of Serbia; we will now view the fighting of the Russians and the Austrians on to the frontier, as it progressed simultaneously with the Russian and German campaigns to be described in subsequent chapters.

For some days before war was declared, as noted in Volume I of this work, Austria-Hungary and Russia understood each other thoroughly. Russia was satisfied that Austria intended to force war on Serbia, and Russia was pledged to protect and uphold the little nation, which was really her ward and over which she had announced a protectorate.

A review of the situation at this time shows that while mobilization was being hastened, Russia had joined the Slav kingdom in asking for a delay on the ultimatum that Serbia had received from Austria on July 24, 1914. On July 27 Russia notified Austria that she could not permit Serbia to be invaded. On July 29 an imperial ukase issued by the czar called all reservists to the colors.

On July 31, 1914, M. Gorymykin, President of the Council of the Russian Empire, issued a manifesto which read: "Russia is determined not to allow Serbia to be crushed, and will fulfill its

duty in regard to that small kingdom, which has already suffered so much at Austria's hands."

Germany on July 30, 1914, had asked Russia to stop its mobilization, and had demanded a reply within twenty-four hours. Russia had ignored the ultimatum, and on August 1 the German Ambassador had handed a declaration of war to the Russian Foreign Minister. On August 6, 1914, Austria-Hungary declared war on Russia, and the Austrian Ambassador left St. Petersburg. In such wise was the eastern arena cleared for action.

Before describing in detail the Austro-Russian campaign, it is necessary to bear in mind the conditions in the opposing armies. The strength of the Austrian army is discussed in the chapter on the Austro-Serbian campaigns, while the fighting forces of Russia are discussed in the chapter on the Russian and German campaigns.

Much has been said, and justly, in criticism of Russia's army at the outbreak of the war and afterward, but there is no disputing the fact that it had been improved wonderfully as the direct result of the war with Japan. In the strenuous years that followed that war, with revolution an ever-present menace, the establishment of a constitutional monarchy, and the granting of religious toleration to the many creeds and sects which helped to make up the population, awakened its diverse people to a new unity, inspired the people with hopefulness and activity, and the *morale* of the Russian army improved accordingly.

The army, at the outbreak of the Great War in 1914, on a peace basis included about 50,000 officers and more than 1,200,000 men, which included about 1,000,000 actual combatants. In recent years preceding, the annual contingent had been about 430,000. At the end of July, 1914, the ukase, which proclaimed a general mobilization, summoned to the colors five classes, or about two million men. The total number was increased by other reservists and volunteers to 4,100,000.

There had been a wave of reform in every branch of the military service. The men who were conscripted to form the main strength of the army were young and possessed more initiative

PICTORIAL MAP OF RUSSIA

than had the recruits of years before. Every effort was made to encourage this initiative under the new field service regulations.

In creating a new army with real fighting spirit, cohesion, and ability, Grand Duke Nicholas, who was made Generalissimo, was conspicuous. Each year the progress made under his direction has been displayed at the autumn maneuvers. Another member of the imperial family, Grand Duke Sergius, was largely responsible for the excellent showing made by the Russian guns and gunners after war began.

For purposes of administration all of European Russia was divided into eight military districts—the Caucasus, Kazan, Kiev, Moscow, Odessa, Petrograd, Warsaw, and Vilna. There were also four Siberian districts, making twelve in all. To each district were assigned two or more army corps. In war, these were grouped in varying numbers from three to five to constitute an army or army group.

The equipment of the Russian infantry soldier comprised at the outbreak of the Great War, a rifle, a 299-mm. weapon with a quadrangular bayonet—which also was carried by noncommissioned officers—a waistbelt supporting a pouch for thirty rounds on each side of the clasp, an intrenching tool, a bandolier holding another thirty rounds carried over the left shoulder under the rolled greatcoat, and a reserve pouch also holding thirty rounds, which completed the full load of 120 rounds for each man, suspended by a strap over the right shoulder.

As the Russian soldiers moved to the Austrian frontier, there was slung over the right shoulder kits containing food and clothing and cooking utensils, and over the left shoulder one-sixth part of a shelter tent. The total weight borne by the regular Russian infantryman was nearly 58¼ pounds.

When the war started, the Russian army, in its invasion of Austria, had its full complement of officers, and because of the great capacity of its military schools, it was as well able as other nations engaged to make up for losses in battle. One sweeping and beneficial change that had been made was that promotion no longer went by seniority but entirely by merit: the higher the position the more rigid the tests. Incidentally, it was Russia's

good fortune that the war came at a time when the noncommissioned ranks were full, and it was possible to promote many of these men to fill vacancies in the commissioned service.

The use of Russian infantry on the battle fields, as we shall soon see, differed in no essential way from that common to other nations of Europe. An advance under fire was almost identical with that of other nations. A single company in attack would dispatch two platoons as a firing line, retaining two in reserve, each of the platoons in front providing its own protection for skirmishing, according to the nature of the ground.

If the cover was adequate, a few rifles were enough to locate the enemy, and either they could be reenforced or the front could be extended. If the ground were quite open, the two leading platoons were extended at once, so as to oppose the enemy with an equal extent of fire, and then advanced by rushes, each section covering the rush of the other by alternate firing. The two reserve platoons could be used either to outflank the enemy, if the nature of the ground permitted, or for direct reenforcement in any formation required.

As has been said, all the nations engaged in the great conflict pursued similar tactics in this respect, and the only advantage possessed by Russia in their use was that both her infantry and artillery possessed a much larger number of officers, who had been trained to understand how, against a powerful opponent, to carry out efficiently in practice and in times of great stress the theory which all nations held in common.

The observer of the battles in the Russian-Austrian campaigns will see that the Russian cavalry was inadequate, because its horses were too small, of inferior strain, and lacking the stamina needed in modern warfare. They were valuable, however, because of their large numbers, and the fact that during the winter months, being acclimated and to the country born, they were able to pick up a living in the snow when other horses would starve.

As regards field batteries, near the western Russian frontier and in Asia, nearly all of them had, when war was declared, eight guns. In most of the batteries in Asia the number of men maintained in peace was the same as in war.

The Russian army moved forward with adequate aerial corps. The keenest interest in military aviation had been taken in Russia during two years before the war. Grand Duke Alexander was one of the founders of the aviation school at Sebastopol, where two-thirds of the Russian aviation officers obtained their training. In the spring of 1914 the air fleet consisted of 16 dirigibles and 360 aeroplanes, while orders for 1,000 aircraft of different descriptions had been placed with various firms in Russia.

The army of Austria-Hungary which faced the Russians was composed of men from a country where universal military service prevailed. In theory only the physically unfit were exempt from service, and the liability extended from the beginning of the nineteenth year to the close of the forty-second. Actual service in the ranks and with the reserve was twelve years. After the men had served ten years with the army and in its reserve, they were included in the Landwehr for another two years. It is likely that Austria had at the outbreak of war from 1,200,000 to 1,300,000 men at her disposal. During the three years preceding she had greatly strengthened her equipment.

The infantry of the joint Austrian army, which had to fight the campaigns against the Russians on the east, and against the Serbians on the south, comprised 102 regiments of infantry, 27 battalions of Jaegers, 4 regiments of Tyrolese Jaegers, and 4 regiments of Bosnia-Herzegovina infantry. Every infantry regiment had four field battalions and a depot battalion. The duty of the latter was to fill up the ranks of the others. Each infantry regiment had at least two machine-gun detachments of two guns each, and in many there were two guns per battalion. In Bosnia and Herzegovina every battalion had four, and this also was true of every Jaeger battalion.

The Austrian infantrymen, as they met their Russian antagonists, carried a small-bore magazine rifle, in use in the army since 1895, and known after its inventor as the Männlicher. It had a caliber of .315 inch and fired a pointed bullet. It was loaded by means of a charger which contained five cartridges, and it was equipped with a bayonet. The cavalry carbine was shorter but took the same bullet. One hundred and twenty rounds were car-

ried by the infantry soldier, and there were forty rounds in the company ammunition wagon, and 160 in the infantry ammunition columns, in addition. The machine gun in use was of the same caliber and took the same ammunition as the infantry rifle. It was composed of few parts, and was a simple and highly effective instrument.

On these first days of August, 1914, the cavalry of Austria—the hussars, uhlans, and dragoons, but really all of one type—light cavalry—was equipped uniformly with saber and carbine. The noncommissioned officers and others who did not carry a carbine rode forth equipped with an automatic pistol. There were forty-two cavalry regiments in the entire Austrian army, consisting of six squadrons, each of which had a fighting strength of 150 sabers, not counting the pioneer troops. Every cavalry regiment had four machine guns with 40,000 rounds of ammunition. The pioneer troops of the cavalry, which first were introduced in Austria, were composed of an officer and twenty-five men, equipped with tools and explosives needed by an advance force to clear obstacles, destroy railways, etc. Besides the pioneer troops, eight men in each squadron were equipped with similar tools. The telegraph section, consisting of eight men, carried about seven miles of light wire.

The artillery of Austria-Hungary had been greatly modified in recent years. The gun used for horse and field batteries was known as M5—that is, the pattern of 1905. It was of 3-inch caliber, a quick firer, throwing a shrapnel shell which weighed 14.7 pounds. High-explosive shells also were carried in the proportion of two to five of shrapnel. The gun had a long recoil on its carriage, which absorbed the shock and the gun returned to its place. This made rapid fire possible.

Like the other powers, Austria-Hungary had adopted a howitzer for its heavy batteries. It fired a shell of 38.132 pounds. There was also a heavy gun in use, a 10.5 centimeter, corresponding to a 4.1-inch gun. The ammunition was like that of a howitzer—a shell weighing 38.132 pounds, which contained a high-explosive bursting charge and shrapnel with 700 bullets,

fifty to the pound. On the march the carriage was separated from the gun, and each was drawn by six horses.

The mountain regions on all the frontiers of the dual monarchy resounded on these August days of 1914 with the mountain artillery. The 10.5-centimeter guns and 4.1-inch howitzer quick firers threw a shell of thirty-two pounds. This howitzer had a range of more than 6,000 yards, and was a powerful weapon. The 30.5-centimeter mortars fired a shell of 858 pounds with a bursting charge of 56 pounds of ecrasite. The extreme range of this mortar was about six miles. Ten rounds could be fired each hour. Two guns and their ammunition lorries were drawn by three large tractors. An hour was required to get one of these guns ready for action.

Let us enter the headquarters of the Austrian army at the beginning of the Russian campaign. There we meet the engineer staff, which built and besieged fortresses, and a military works department, which built and maintained buildings that were not immediately connected with fortifications. Austria-Hungary had only a few fortresses of modern construction. The intrenched camps in Galicia, Cracow, and Przemyśl were soon to be besieged, and between them was a fortress known as Jaroslav, of insignificant value, like that of Huy between Liege and Namur in Belgium.

The Austrian army had not made as much progress in aeronautics as those of other nations. There was a depot for dirigibles at Fischamend, about eleven miles southeast of Vienna, but only a few dirigibles were ready for service. These were of the Parsefal type. There were a number of captive balloons. The number of aeroplanes available was very small. A school for teaching aviation had been established at Vienna-Neustadt.

The faces of the soldiers of the Austria-Hungarian army on the Russian frontier denoted many races, but it possessed considerable solidarity. Officers and soldiers recognized alike that they were all under a single head—the emperor. The officers were drawn from all classes of society, and this was also a unifying influence. They were on more intimate relations with their men

than the Prussian leaders, and "led" instead of "drove" them. Commands for the whole army were given in German, but otherwise the language varied according to the composition of the various regiments as regarded races. The use of the German language for commands undoubtedly aided in unifying the army.

CHAPTER LXII

GENERAL STRATEGY OF THE CAMPAIGN

THE Austrian army faced the Russians on August 11, 1914, with a well-organized strategical plan. Austria, realizing the importance of unity, cohesion, and harmony in her own forces, proposed at the outset of the war to dissipate the strength of her enemy, Russia, by causing an uprising in Poland. The vanguard of Austria's advance along the Vistula consisted of the Galician army corps, made up of Polish soldiers. Along the border, arms and ammunition had been collected for the anticipated insurrection. A proclamation was sent by the Polish associations of Galicia and Posen to their "brethren of Russian Poland." In this, the Poles of Russia were urged to prepare for a rising, but not to attempt it until the Austrian vanguard had arrived and won a first battle. Then arms would be provided for them.

Russian strategy checkmated this plan. The czar issued a proclamation promising home rule to Poland as soon as Germany and Austria had been repulsed. With this home rule he also offered self-government and freedom of law and religion, and the reconstitution of the old Polish territory by means of the annexation of Posen and Galicia. This move divided the Polish leaders and stifled the incipient revolution.

The spy system won and lost the first strategical battles before a shot was fired. There is no doubt that the Austrians before the war knew almost as much about Russia's preparations as did the Russians themselves. The Austrian system of espionage was elaborate and accurate, and the Austrians profited by that of

Germany also. Nevertheless, Russia surprised her foes and allies alike by the rapidity with which she got her troops into action on the offensive once war was on.

The Russian army was handicapped by lack of railroad facilities, but she made the most of them. Her total mileage was about 25,000, her system being inferior to that of Germany or Austria. Germany's was by far the best of the three. Many of the Russian roads had but one line of track, their construction was inferior, stations were farther apart, and the speed of trains was comparatively slow. They could not carry as much traffic as those of either of her two adversaries. The gauge of the Russian roads was 5 feet, so that the rolling stock could not be used on German and Austrian roads, which had a uniform gauge of 4 feet 8½ inches. The management of Russian railroads was too complicated for army purposes. But Sukhomlinoff simplified it and instituted schools in which army officers were instructed in putting soldiers on cars rapidly and routing trains to the best possible advantage. This and other activities of Sukhomlinoff, along the line of reform and improvement, were in no small measure responsible for the rapidity with which Galicia was invaded.

Austria's military problem was a difficult one from the start. Her ally, Germany, could not extend much military assistance until a decisive blow had been struck in the western theatre of war, but Austria, having a million men in readiness and being strong in artillery, was expected to assume the offensive from the start and attack the imperfectly mobilized Russian forces in western Poland. An immediate offensive was required, because she must hold Galicia at all cost.

There were three places where Russia might cross the frontier of Galicia—west of the point where the waters of the San empty into the Vistula, between the Upper Bug and the San, or along the line of the River Sereth on the east. There was great danger in a combined movement by Russia against the first and third sections of the frontier which would cut off and surround the forces of Austria which were based on Przemyśl and Lemberg. In order to avoid this peril, apparently the safest as well as boldest plan was to proceed northward against the fortresses of Warsaw.

Such an advance would in all probability prevent the armies of Russia from crossing the Vistula and postpone any attack against the Sereth from the east.

Austria was staking the success of such tactics on the incompleteness of mobilization by the Russians, and therein she proved to be in error. Indeed, the quickness of Russia's military movements amazed the entire world, with the exception of her Generalissimo, Grand Duke Nicholas, and his aides and advisors.

At the outbreak of the Great War, Nicholas was in command of the St. Petersburg military district. Under him was a Corps of Guards, and the First and Eighteenth Army Corps from 120,000 to 150,000 men. He was a soldier of the first rank and an able strategist. He had familiarized himself with the armies of other European nations. He long had planned for the emergency that now confronted him.

In the rapid movement of the Russian forces, he was aided chiefly by General Vladimir Sukhomlinoff. The latter saw that one of the chief defects in the Russian army, as disclosed by the Japanese War, was the slowness of her railroad operations, and some time before war was declared he had set himself to improving conditions. He established a school of railroading for officers where the rapid loading of troops on cars and the general speeding up of transportation was studied scientifically. The good results of such work was apparent at the very outset of hostilities.

As we have seen, France was saved in the first campaign in the west by the sturdy resistance of little Belgium to the advance of the Germans through her territory, so Russia now helped to save France a second time by the rapidity of her campaign. While German troops still were investing Liege in Belgium, the Russian troops were registering their first triumph at Eydtkuhnen, and upon the very day that Ghent fell into the hands of the Germans, Russia began her strong offensive in East Prussia. By such means were a large part of the German forces, intent on taking Paris, diverted from attack on the western war arena to protect the eastern frontier from Russian menace. The relief which Russia thus gave her Allies was invaluable. The battle of

Mons was over in Belgium and the retreat to the Marne in France had begun, and the Germans were almost in sight of the French capital, when, save for Russia's timely blow on the Polish frontier, the Germans, many war critics believe, would have reached Paris.

When the Germans in the west were striving toward Calais on the English Channel as their goal, it was the Russian offensive in Galicia that forced Germany to transfer more army corps to the eastern front in order to stop the tide that threatened to overflow Austria. Thus the French and British were able to stop the advance that threatened to engulf them on the western front and given time to organize themselves for a strenuous contest.

The problem in strategy which confronted Russia was much more complicated than that which had to be solved either by Germany or Austria. It was quite evident to her General Staff that at least during the first few months of hostilities Germany would devote her whole time and attention to attack in the western arena, the French being at the time her most dangerous enemy. Except for a small part of the Austrian forces left to oppose the Serbians and Montenegrins, the whole army of Austria was depended upon to oppose the Russian advance.

The important strategic condition that confronted Russia was this: Her most dangerous enemy was Germany, but in order to attack Germany it was necessary that Austria's army should first be destroyed.

The eastern theatre of the war has been described in a preceding chapter and it will be recalled that for about two hundred miles from east to west Russian Poland is inclosed on the north by East Prussia and on the south by Austria. Moreover, the Sudetic Mountains on the Austrian frontier and the huge forests of Poland protect the position of German Silesia southeast of Breslau. Passing through it are the chief lines of railway connecting eastern and western Europe, including the routes between Poland, Galicia, Moravia, and Bohemia. At varying distances from her Russian frontier Austria has a line of mountains of great defensive strength. This is the Carpathian, which, extending inside the Austrian-Russian border line, is joined by the

Transylvanian Alps and continues to form the south frontier of Austria.

It would not be possible for the Russian invaders to menace Austria seriously until these mountains had been crossed. Russia, however, was menaced by the configuration of the German-Austrian frontier, with Poland open to invasion from three sides. Also, Austria and Germany had many strongly intrenched positions at strategical points covering all the chief lines of approach on their frontiers where the latter faced Russian territory. Besides being defended by artificial works, the frontier had natural defenses, such as lakes, swamps, and forests. All along the Russian-Austrian frontier, in fact, there exist such natural defenses against invasion. On the southern boundary of Poland the Russian army was held off by great bogs which cover from east to west a distance of about 250 miles. The only crossing was a single line of railroad, the one extending from Kiev to Brest-Litovsk. From a military viewpoint, these marshes divided the line in two parts, imperiling the situation of any fighting in front of them in case of defeat. They would offer no kind of sustenance to troops driven within them.

Russia was not prepared to put into the field an army large enough to hold the entire line from the Baltic to the Rumanian frontier, approximately 1,000 miles, and there was no time, if part of the German forces were to be diverted from the western front, to raise such forces and equip them.

At the beginning of hostilities on August 11, 1914, the chief offensive against Russia was intrusted to the First Austrian Army under General Dankl. This was composed of about seven army corps, having various additional units, or amounting in all to about 350,000 men. This army had its base on Przemyśl and Jaroslav, and the work which had been assigned to it was to advance upward between the Vistula on the left side and the Bug on the right, on to Lublin and Kholm. There it was to sever and hold the Warsaw-Kiev railroad so the line would be exposed in the direction of Brest-Litovsk and the chief communications in the rear of Warsaw. The First Austrian Army, while it advanced to this position, would have as protection from attack on its

right and rear from the east and south the Second Army under General von Auffenberg. This army, advancing northeast from Lemberg, would control eastern Galicia from the Bug to the Sereth and the Dniester.

The numerical strength of Von Auffenberg's army at the start probably was about 300,000, and consisted of five army corps with five divisions of cavalry. This, however, was only its initial strength. As hostilities developed Von Auffenberg added to his strength until he is reported to have had no less than six corps and additional cavalry. At first this increase came from the Third or Reserve Army, over which Archduke Joseph Ferdinand had command. While General Dankl was advancing toward Lublin on August 28, 1914, being protected on his right flank by Von Auffenberg, the army of the Archduke appears to have been pushed out in a similar manner on the left.

CHAPTER LXIII

AUSTRIA TAKES THE OFFENSIVE

THE Austrians crossed the Polish border on August 29, 1914, and moved on as far as Kielce and toward Radom without encountering serious opposition. That may have been as far as it was intended to proceed. In all three of the armies of Austria there were about 1,000,000 men, and against these forces were arrayed three Russian armies—a small force on the Bug, which may be called the First Russian Army; a Second Russian Army under General Russky, which was moving on Sokal from the Lutsk and Dubno fortresses; and a Third Army under General Brussilov, which was proceeding against the Sereth. There were about 300,000 men in each of the two latter armies.

Now the Russian strategy on September 1, 1914, was this: It was intended that their First Army should retire before Dankl, the Second Army to menace Lemberg from the northeast and put its right wing between Dankl and Von Auffenberg, and the

Third Army to advance from the Sereth to the town of Halicz on the Dniester, and so finish the investment of Lemberg on the south and east.

It may have been, though this is not certain, that the General Staff of the Austrians did not see the close connection between the movements of Russky and Brussilov. It may be that they believed they had only Brussilov to face at Lemberg, since Russky would be obliged to proceed to the aid of the First Russian Army on the Bug.

Russky was famed as a highly scientific soldier, being a professor in the Russian War Academy. In the war with Japan, he had been chief of staff to General Kaulbars, the commander of the Second Manchurian Army. Afterward, he had been closely associated with General Sukhomlinov in the reorganization of the Russian forces. Brussilov, whose army consisted of men of southern Russia, was a cavalry general and had seen service under Skobelev in the Turkish War of 1877. General Ewerts, in charge of the Third Army, the smallest of the three, whose duty was to fight a holding battle, was a corps commander.

No serious resistance was made by the Russians against the main Austrian advance under General Dankl, and it proceeded almost to Lublin. At one time it was within eleven miles of that place.

On August 10, 1914, the Austrians who had crossed the frontier had a front of about eleven miles wide to the west of Tarnograd. The Russian frontier posts had a brush with the advance cavalry of the Austrians and then fell back. There was a second skirmish at Goraj and a more serious meeting at Krasnik, and the Russians still retreated. The Austrians were jubilant over their victory at Krasnik and at the few delays they encountered at the hands of the enemy. The Russians in their retreat proceeded toward the fortified position of Zamosc or toward Lublin and Kholm.

In the meantime Russia had been gathering an army on the line from Lublin to Kholm. There the Russians had the railroad behind them, in one direction to Warsaw, and in the other to Kiev and Odessa. Each day as the Austrians advanced the

strength of the Russian army was improving. In the early days of September, 1914, it probably amounted to 400,000 men.

When the Austrians were within fifteen miles of Lublin they first encountered heavy resistance. They were checked and then delayed, but the Russians were not ready to do more than hold their antagonists. They were waiting for developments farther to the southeast.

On August 17, 1914, the Russian offensive had its definite start. General Dankl was finding himself with the First Austrian Army; when he stopped in his advance toward Lublin, General Russky began a powerful attack against Von Auffenberg. Co-operating with Russky, as we have noted, and on his left was Brussilov, the total forces of these two commanders being at first double those with which Von Auffenberg was equipped to oppose them. As soon, however, as Von Auffenberg became aware of the numerical superiority of his opponents, he drew for reinforcements on the Third, or Reserve Army, which had advanced into Poland as far as Kielce.

The latter troops hurried to join Von Auffenberg, crossing the Vistula by means of bridge boats at Josefow. When the issue really was joined, the troops of the Third Austrian Army, under the Archduke Joseph Ferdinand, were ready to act in close cooperation with those of Von Auffenberg. Thus, in the armies on both sides there were, in all, about 1,200,000 men, with the advantage in favor of the Russians. Having this superiority in numbers, Russky felt that he was safe in attempting to envelop the Austrian forces on both flanks. With the larger army—the Second—he hurled his troops at the Austrian left and center, advancing along the railway.

On August 22, 1914, the Russians crossed the frontier and on the following day, Russky occupied Brody, with small opposition. On the same day, Brussilov, on his left, also crossed the frontier at Woloczysk, which is the frontier station on the Lemberg-Odessa railway. At this point the rolling stock used by the Russians on their own railway in their advance was no longer available, as the gauge of the Russian and Austrian lines differs. The Austrians had retired with their own rolling stock in the di-

rection of Lemberg, destroying what they did not take away, and so the Russian advance from that point was continued wholly, perforce, on foot. There was a good wagon road which ran parallel to the railroad toward Lemberg, and along this Brussilov's cavalry hurried.

CHAPTER LXIV

A CAUTIOUS RUSSIAN ADVANCE—RUSSIAN SUCSESSES—CAPTURE OF LEMBERG

ON AUGUST 23, 1914, the Russians were almost on the heels of the retreating Austrians. After three hours' fighting, they drove them out of Tarnopol. Thereupon they retreated along the line of the Zlota Lipa, which is an affluent of the Dniester and runs almost directly southward.

On August 25 and 26, 1914, there was some heavy fighting along this river, especially at Brzezany. Heretofore, the army under Brussilov had not met with any important resistance, having encountered chiefly frontier posts, skirmishers, and small detachments of Austrians. It seems that no great body of Austrians had penetrated much beyond the Zlota Lipa. On the eastern side of this river was a line of low hills, offering a fine defensive position; the Austrians hastily began to make use of them. They were still constructing trenches when the Cossack cavalry appeared, driving the skirmishers of the Austrians before them.

A fight began on August 24, 1914, which lasted ten days. The Russian cavalry was not strong enough to attempt to take the Austrians' intrenched position, and therefore waited for the main body of the Russian forces to come up. The fight extended over twenty miles of front, stubbornly contested by the Austrians. Finally, by direct assault, the Russians took the position and the Austrians fell back, in good order, toward Halicz, where the Gnita Lipa joins the Dneister.

In the meantime, while Russky was thus pounding at Von Auffenberg's right, Russky was attacking his right and center.

Having crossed the frontier between Brody and Sokal, Russky extended his forces on a wide front. While the center advanced straight for Busk and Krasne in a direct line toward Lemberg, the right, proceeding almost due west, was attempting to penetrate between the army of Von Auffenberg and that of Dankl on the north, and was pushing powerfully on Von Auffenberg's left. Gallantly resisting, the Austrians were forced back in all directions, slowly but firmly. The fighting on Russky's right and center was especially fierce and severe and resulted in great losses on both sides.

By the time Brussilov had taken the position on the Zlota Lipa, his right was in touch with Russky's left, and the first stage of the campaign was over. That Russia had been able to proceed so far with her plans would seem to indicate that the Austrians had underestimated the rapidity with which she could complete her preparations. It was the fall of Tarnopol that made possible a junction of the Russian armies and enabled them to advance in a united line upon Lemberg.

General Brussilov had to move to the attack without attracting attention. This was accomplished by both Russky and himself throwing out a screen of Cossacks all along the frontier of Eastern Galicia. For an extent of one hundred and fifty miles, the Cossacks skirmished at every border road or bridge between the Bug and the Dniester rivers. They started this immediately after war was declared and soon, so inconsequential did such activity appear, that the Austrians, it seems, came to regard it as lacking any real purpose. After the third week in August, however, the commander at Lemberg sent a force of 2,000 men to make a reconnaissance in Podolia.

These troops arrived at Gorodok, a small town across the border. Their presence there was most inconvenient for the Russians, for General Brussilov was at that time advancing with a big army through Gorodok on toward Galicia. It was imperative that the Austrian reconnoitering troops should be stopped and the only force available for this purpose was nine hundred Cossacks stationed at Gorodok to screen the main army. It was necessary for these Cossacks to repulse the Austrian reconnoiter-

ing force, without calling for large reenforcements. If the latter were done, it would excite the suspicions of fugitives from the fight.

Therefore, the Cossacks lined out in the woods far beyond the village and then thirty of them went forward from cover to cover until they came upon the Austrians. Simulating surprise, they fled in apparent panic. The Austrians entered upon a swift pursuit and were led into ambush. Thousands of them were cut down by a cross-fire of rifles and machine guns. The rest were pursued by Cossacks over the border and the invasion of Galicia was begun by the Russian main force.

Then began the perilous part of the enterprise. The army of Russky was advancing on Lemberg from the north and the army of Brussilov was converging on the Galician capital from the east. After they had been united, they would assuredly outnumber the Austrian force which was guarding Lemberg, but in the meantime either Russky or Brussilov was too weak to escape defeat. Each might be met singly and overwhelmed. The skill with which their combined operations were carried out was such, however, that General Brussilov was able to steal into Galicia and occupy a large part of the country before battle actually was joined.

The secrecy with which his great movement was executed was extraordinary. It was executed in daylight, covering a period of thirteen days, from August 19 to August 31, 1915. It was performed in spite of the fact that the Austrians had many spies, a large force of trained cavalry, and scouts in aeroplanes darting over the frontier. Yet not until it was too late did the Austrians discover the real nature of the Russian turning movement in Eastern Galicia.

In part, this was attributable to the fact that the territory in which Brussilov was operating was an ancient Russian duchy which had been wrested from the ancestors of the czar. Eastern Galicia might be compared to Alsace-Lorraine, which had been torn from France. Peopled by a Slav race, Eastern Galicia had the same language, religion, and customs as the soldiers in Brussilov's army.

When at the beginning of operations, Russia first assumed a general offensive on August 17, the Grand Duke Nicholas issued the following proclamation addressed to Russian inhabitants of Galicia:

"Brothers—A judgment of God is being wrought. With Christian patience and self-annihilation, the Russian people of Galicia languished for centuries under a foreign yoke, but neither flattery nor persecution could break in it the hope of liberty. As the tempestuous torrent breaks the rocks to join the sea, so there exists no force which can arrest the Russian people in its onrush toward unification.

"Let there no longer be a subjugated Russia. Let the country which forms the heritage of Saint Vladimir throw off the foreign yoke and raise the banner of united Russia, an indivisible land. May the providence of God, who has blessed the work of the great uniters of the Russian lands, be made manifest. May God aid his anointed, the Emperor Nicholas of All the Russias, to complete the work begun by the Grand Duke Ivan Kalita.

"Rise, fraternal Galician Russia, who have suffered so much, to meet the Russian army for you and your brethren, who will be delivered. Room will be found for you in the bosom of our mother Russia without offending peaceable people of whatever nationality. Raise your sword against the enemy and your hearts toward God with a prayer for Russia and the Russian Czar!"

This proclamation was received in Galicia with acclaim. When the Russian soldiers came, priests and people came out from the villages with flowers and banners to meet their "little brothers." Flowers were thrown on their heads from the upper balconies of houses, as they marched through the streets. Whatever could be done by pretended ignorance or silence to mislead the Austrians regarding the Russian advance was done by peasants.

Meanwhile, General Brussilov was making the most of his opportunities. As quietly as possible, he passed over the tributaries of the Dniester and without revealing his strength pushed back the Austrian cavalry screen. For this work he had to depend on the Cossacks, without infantry support or any considerable show of artillery power.

While appearing to be merely a border raider, the Cossack had to veil his main army and clear its path through bridge-heads, forts, and blockhouses, and he was well suited to this kind of work. Moving at the rate of eight miles a day in advance of the infantry and the big guns, he maintained a continual skirmish with cavalry scouts, infantrymen, and gunners in places that had been fortified, and even armored trains.

In all, the Cossack in the Galician campaign, proved himself not only a most efficient soldier but well behaved. Previously, his reputation had been an evil one. Naturally, there were reports of brutality and savagery, but none were proved. In fact, neither on the part of the Russians nor the Austrians was there manifest any of the "frightfulness" attributed, rightly or wrongly, to combatants in the western theatre of war.

It was, of course, not to the interest of the Russians to mistreat the people of Galicia. They came, in their own estimation at least, as deliverers, not as despoilers. As for the Austrians, they were in their own country when in Galicia. When they penetrated north into Russia, it appears that they did little wanton damage. On their return, it is true, they laid waste a large part of the province of Volhynia, burning villages and farmsteads as they proceeded. But this was dictated by military exigencies, in order to delay and inconvenience their pursuers.

There was an occasion when it might have been supposed there would have been excesses. This was when after an Austrian defeat, the Russian van, composed of three divisions of Cossack cavalry, pushed through Halicz in pursuit of the enemy. The victorious troops swept through a country, full of Jews, and utterly undefended. It was a garden of plenty, a rich and fertile country. Instead of presenting a picture of desolation and ruin after the Russian army had passed, its cattle still grazed in the fields, the fields were full of shocks of grain, and chickens, ducks, and swine wandered about the streets of the town.

There was not a single wrecked house in the town itself, only a few buildings, such as warehouses near the railway station, having been demolished by the Russians in order to hasten the departure of the enemy.

While he may be said to have lost this preliminary campaign, his army was unbeaten. Immediately it fell back into the powerful and carefully built line of defenses in front of Lemberg, extending over a front of seventy or eighty miles, from the vicinity of Busk on the north to Halicz on the Dniester, on the south. An irregular extent of volcanic hills, some containing extinct craters, extended along the greater part of its length, and ended on the south in a ridge parallel to the Gnita Lipa as far as the Dniester. The northern end of this territory was skirted by the railway running due east of Lemberg. The Austrian left rested, north of the railroad, on the River Bug and the lake district around Krasne. Artificial fortifications improved these natural defenses. There were many miles of trenches with barbed-wire entanglements, and at different points massive fortifications of concrete and steel. The position was difficult to take at any point.

On August 26 and 27, 1914, after the forces of Russky and Brussilov had been joined, the Russians immediately began their attack along the entire front. The days that followed were replete with furious charges. Positions were taken only to be surrendered. Bayonet fighting figured largely in the clashes. After two days, though the Austrian lines were still intact, the Russians claimed a victory. Events came about in this way: After he had forced the crossing of the Zlota Lipa on August 26, and his right wing had connected with Russky on the north, Brussilov had extended his left, by forced march through a country almost devoid of roads, as far to the south as the valley of the Dniester. On August 31, 1914, the main body of this flanking body arrived in front of Halicz. On the day following, September 1, 1914, a furious attack began. More guns were brought up and a fierce attack was concentrated near the little village of Botszonce, where the enemy had taken a position. Afterward, the condition of the field, which had been literally plowed up with shell fire and strewn with the débris of cannonading and accouterments, showed how terrific the conflict had been. The final assault was made by the Russian Ninth and Fifty-ninth Infantry under cover of a heavy shell fire. Enormous losses were sustained, but

the Russians were enabled to make a breach some kilometers wide in the Austrian line.

Then the entire Austrian line began to give way. A desperate stand was made as a last resort in the village of Botszonce itself, but this was turned into a useless sacrifice when the Russians, pushing forward heavy guns, unlimbered them on the same hills where the Austrians had fought so determinedly and quickly reduced the town to ruins.

On September 3, 1914, the Austrian retreat began in earnest. Where the fighting had been hottest around Botszonce and Halicz, the Russians claim they buried 4,800 Austrian dead and captured thirty-two guns, some of which had been mounted by the Austrians but taken before they could be brought into use. The Austrian reports deny such figures, while claiming heavy losses by the Russians.

There was a fine steel bridge across the river Dniester at Halicz, and the extreme right of the retiring Russian army crossed this, with the Russian cavalry pursuing. The bridge was destroyed and also the only other bridge in that region of the Dniester at Chodorow. In such wise was the pursuit southward delayed until pontoons could be thrown across the stream by Russian engineers.

This was done on the following day, whereupon Cossack cavalry to the strength, it was reported, of three divisions, crossed the river and came up with the retiring enemy. Behind the cavalry at a short distance came several divisions of Brussilov's infantry, which rapidly pushed across the south of Lemberg toward Stryj.

After the extreme right of the Austrian line had been shattered and Russky had been victorious in his attack on the other extreme, the whole line fell apart quickly and while the entire front was exposed to attack, the Austrian left was being enveloped from the direction of Kamionka by a flanking movement. One end of the Austrian line was being broken and the other bent back. The Russians increased the fury of their attack and it was not long before the entire Austrian army was in retreat.

On September 2, 1914, Lemberg was in the hands of

the Russians. This city, otherwise known as Lwow or Löwenberg, was first known as Leopoldis, being founded in 1259 by the Ruthenian Prince Daniel for his son Leo. His history had been a checkered and stormy one. In 1340 it had been captured by Casimir the Great; it had been besieged by the Cossacks in 1648 and 1655, and by the Turks in 1672; it had been captured by Charles XII of Sweden in 1704, and bombarded in 1848. As capital of the crownland of Galicia, it had come to be a handsome city, of many parks, wide boulevards, three cathedrals, many churches, and a great number of important public monuments. It was the seat of a university which contained a highly valuable library of books and manuscripts and a great many treasures of historic and antiquarian interest. Its population was about 200,000.

The Austrians declared that Lemberg had been evacuated in order to save all these treasures from destruction. It is certain that the civil population of the town was strongly opposed to its being defended. It was cosmopolitan and contained elements, doubtless in the minority, who sympathized with Russia and who welcomed the Russian troops with great enthusiasm. Whatever other reasons may be given for its abandonment, however, the fact remains that any attempt to hold it would have been futile.

After the Russians had taken possession of Lemberg, tranquillity again prevailed. Although it was crowded for a considerable time thereafter with Russian soldiery, there was no violence, disorder, or confusion. On every hand were seen Russian soldiers of all branches of the service fraternizing with the people of the place. If a soldier even jostled a civilian accidentally he saluted and apologized. No drunkenness was permitted. A considerable number of Austrian policemen continued to patrol the streets, with a Russian badge on their arms, however.

Austrian surgeons and nurses, left in the town when the Austrian troops retreated, continued to help care for Austrian wounded, also left there, and received the same pay for their services as their Russian associates of the same rank. Austrian

Red Cross attendants were allowed to walk about the streets at will, unmolested.

After its occupation by the Russians, Lemberg at once became a huge hospital base. For the care of wounded that daily came in from the front, there were forty-two immense institutions.

The inhabitants of Lemberg welcomed the Russians as deliverers. A deputation came to General Russky and requested him to make known to the czar the readiness of the whole Slav population of the city to be loyal "sons of Russia." In surrendering the government to Count Bobrinsky, whom the czar appointed Governor General of Galicia, M. Rutovsky, Mayor of Lemberg, said:

"Not without our cooperation have the Austro-Hungarian troops left Lemberg, without firing a shot. There was no struggle here, thanks to our efforts. We believe your excellency has been informed that your troops found here cooperation and a cordial reception.

"In proffering the government of this capital, allow me to express my gratitude to the former military governor, who lessened our hardships.

In his reply, Bobrinsky outlined the principles of his policy:

"I consider Lemberg and East Galicia the real origin of Great Russia," he said, "since the original population was Russian. The reorganization will be based on Russian ideals. We will immediately introduce the Russian language and Russian customs. These steps will be taken with the necessary care.

"We shall at first limit this to the appointment of Russian governors and other officials. Many of the present officials will not be replaced. We shall forbid the convocation of your Legislature during the war. All social and political organizations must be discontinued, and may resume their activities only by permission. These precepts obtain only in East Galicia; West Galicia will be treated differently."

The Russians considered Lemberg to be of great strategical importance. Railroad lines radiated from it in all directions giving its captors direct communication with Kiev and Odessa, with their fortified positions at Dubno and Rovno and thence

to Petrograd, with Brest-Litovsk and Warsaw—save only for the inconvenience of changing the gauge at the frontier. Soon after crossing the frontier, the Russians had changed the gauge of many of their engines and cars to fit the Austrian gauge. They found at Lemberg thirty locomotives and a large number of railway cars left there by the Austrians.

When on September 3, 1914, the Russians entered Lemberg, the official Russian announcement of its taking was as follows:

"Seven days of the most stubborn fighting in Eastern Galicia have resulted in a complete victory for the Russians. Five Austrian Corps were completely routed, and in retreating in disorder westward, abandoned their arms and baggage.

"Besides an enormous number of killed, the Austrians lost not less than 40,000 prisoners, including many generals. The roads of retreat of the Austrians are so encumbered with carts, guns, and impedimenta that the pursuing troops are unable to use the roads. Panic is spreading among the Austrian troops. During the seven days the Russians have taken over 200 guns, several colors, and about 70,000 prisoners. Lwow (Lemberg) is in our hands."

Russia received this report with great joy. The news of the occupation of the town was conveyed by Grand Duke Nicholas to the czar. The Fourth Class of the Order of St. George was bestowed on General Russky for "his services in the preceding battles." The Third Class was given him for the capture of Lemberg. The Fourth Class of the same Order was bestowed on General Brussilov. Throughout the empire, Thanksgiving Services were held to celebrate "the reunion with Galicia." General Count Bobrinsky was appointed Governor General of the province.

CHAPTER LXV

DANKL'S OFFENSIVE AND RETREAT

LET us now turn our attention to the scene of operations further north. There, it will be recalled, was taking place the principal Austrian offensive by the First Army commanded by General Dankl. In the middle of August, he was being held up by the armies of Generals Ewerts and Plehve, who barred his way toward Lublin and Kholm. A strong offensive was not attempted then by the Russians against him, as they were gathering strength and waiting until Dankl's army should be cut off from reenforcements. It was desired that their advance take place at the same time as the completion of the advance on Lemberg of Russky and Brussilov. Finally, on September 4, 1914, the brief official announcement was made by Russia:

"Our armies on September 4 assumed the offensive along a front between the Vistula and the Bug."

Coming as it did, when the Russian people were rejoicing over the taking of Lemberg, this news was greeted with great enthusiasm.

It will be recalled that when Russky's army advanced, a portion of the Austrian Reserve Army, commanded by Archduke Joseph Ferdinand, was hurriedly withdrawn from the position it held in Poland on the left of the Vistula, across the rear of Dankl's army, to assist General von Auffenberg.

This was referred to as an "advance," in a "communiqué" published by the Austrian General Staff on September 3, 1914. It is probable that at that very early date some German troops also were being brought up for the same purpose. Some of the Austrian reenforcements had been joined with Von Auffenberg's army and had shared in its reverses. Some had remained to screen Dankl on the right.

After Von Auffenberg's army began to encounter difficulties and its progress was stopped, the gap between its left and Dankl's right and rear grew too large for safety, so that there

was a hurrying of forces from the left bank of the Vistula to fill the gap. Later, as the Russian strength grew, an entirely new Austrian army was assembled, consisting, it seems, of portions of the Third or Reserve army under Archduke Joseph Ferdinand, which was augmented by two corps withdrawn from the Serbian frontier, and also some German troops.

The "Fourth" Army, under the command of the Archduke, was referred to thereafter in official announcements by Russia as the "Tomaszow Army." To strengthen Dankl's left, which lay upon the Vistula at Opolie, German troops from Breslau also were brought up.

In the last part of August and the first part of September, 1914, there was considerable confused fighting between detached forces on both sides in the frontier country between Zamosc and Sokal. Both sides claimed successes. The Russians claimed that their wedge was driven through successfully to Tomaszow and that there a severe defeat was administered to the Austrians.

From there the latter retired to the swampy land about Bilgoraj and upon Tarnograd. The tactics of the Russians had put a last barrier between the two principal sections of the Austrians. Interest thereafter centered in Dankl's First Army.

Fighting on the Lublin-Kholm front, having been purely defensive on the part of the Russians, at first, had grown fiercer as days passed, until there was continuous battle along the entire line. When Von Auffenberg had been defeated and his right and rear threatened, the condition of the northern army seemed so critical that General Dankl decided to force the issue. He might fall back or break through the Russian defense. He decided to attempt to pierce the line between Lublin and Kholm. On September 2, 1914, the Tenth Austrian Army Corps led the assault against the weaker part of the Russian line and reached within eleven miles of Lublin. There it was halted, and so the Austrian offensive seems to have spent itself.

As we have seen, the Russian offensive began definitely on September 4, 1914. According to the Russian official announcement, two days later, "the enemy's center, lying in the region west of Krasnostaw (this being almost due north of Zamosc,

about halfway to the center of a line drawn from Lublin to Kholm) was particularly disorganized. The Forty-fifth Austrian Regiment including the colonel, forty-four officers, and 1,600 men were surrounded, and surrendered. The same announcement stated that "a German division, coming to the aid of the Austrians, was attacked on the left bank of the Vistula." Presumably, the Russian troops there had come from Ivangorod.

After the Austrian First Army began to retire, it was followed by the Russian forces along its line. And this line, at first, was approximately eighty miles. As it retired, the left wing being hemmed in by the River Vistula, and the right feeling steady pressure from Russian forces on the right, where direct retreat was prevented by the swampy nature of the country, the front was contracted until it was less than forty miles.

This had been accomplished by the time the army reached the San, where it was necessary to effect a crossing by four or five bridges at different points. Dankl was highly praised for the manner in which he handled his army during this retreat, and saved it from destruction. In Russia, it had been assumed that the retreat would degenerate into a panic and the fate of the First Army was regarded there as practically sealed. Russian strategists themselves speak in high terms of the way Dankl handled his army in this crisis.

The Austrian advance on this front had its high mark on a line drawn from Opolie on the Vistula, through Krasnostaw to Grabiowiec, whence the line curved southward toward Tyszowce. And it was in the region of the latter place that the Austrians claimed a big success, though this was denied by Petrograd.

After the Russian advance on this front from Lublin and Kholm, as we have seen, had begun with the "disorganization" of the Austrian center at Krasnostaw, the next attempt was to strike at the Austrian left, starting at Opolie and developing thence along the entire line as far as Turobin.

It was on this wing of the Russian army that the chief strength had been assembled, the other parts of the line being left comparatively weak. Reasoning that even if the Austrians were able to break through the front, where it was weaker, it would

only make more certain their being surrounded finally, all new troops that arrived were shifted over to the right wing.

On September 5 and 6, 1914, the Russians attacked the Austrian army at Tomaszow, situated northeast of Krubessiow and southeast of Rawa-Russka. The Austrian army retired.

Near Frempol, the Russian cavalry rushed big convoys of the enemy in the direction of Lublin. Troops and convoys which were moving in the direction of the road leading from Josefow to Annopol were dispersed by Russian artillery on the left bank of the Vistula.

Detachments of the Fourteenth Austrian Army Corps attempted an attack near Rawa-Russka, during the night of September 7, but were repulsed. Near Tomaszow the Russians took an enemy aeroplane.

Aerial battles were not infrequent. Captain Nesteroff, one of the most daring of Russian aviators, sacrificed his life in a successful attempt to destroy an Austrian aeroplane. He was returning from the front after an aerial reconnaissance when he saw an Austrian aeroplane hovering over the Russian forces with the intention of dropping bombs.

The Russian aviator immediately headed straight for the Austrian machine at full speed and dashed into it. The force of the impact caused the collapse of both machines, which plunged to earth, both aviators meeting instant death.

The fortress of Nikolaieff, twenty miles south of Lemberg, was taken by the Russians after severe fighting. The fortress was one of the most modern military strongholds in Austria, being supplied with all the newest forms of defense and offensive weapons. It had steel cupolas, masked ranges of earthworks, and guns of modern type and heavy caliber.

The Nikolaieff fortress commanded the passage of the River Dneister. At the fortress, forty guns of the heaviest type and stores of all kinds were captured. Like Lemberg, the fortresses had been well stocked with provisions, which fell into the Russians' hands.

After occupying Nikolaieff the Russians undertook, after allowing their soldiers only two hours of rest, a night march for

the purpose of attacking new positions occupied by the enemy. A Russian battery, placed on the Vistula River, engaged with success an Austrian steamboat armed with rapid-fire guns.

About the same time troops were sent by train from the east of Lemberg to near Chelm, and put in action against Austrian infantry intrenched on a long line, which included the village of Michailowka. The Russians entered the village the same night, the Austrians having fallen back to a half circle of small, steep hills which overlooked the town. Some houses had been set afire, but the flames had been extinguished by the villagers themselves.

At three o'clock the following morning the attack on the hills began. The Austrians occupying them numbered 15,000, of which a large number were in a deeply wooded gorge. The Russian artillery swept the crest of the hill and shelled the gorge with shrapnel. The Austrians replied strongly.

At noon the position was stormed. The Russians, at the word of command, rose with cheers and rushed the hill. Austrian guns to the left cut them down badly. Later, after a desperate, brave fight, the position was taken. The gorge was full of dead men lying in heaps. Officers said they had never seen so many dead lying in a single place. The troops gave the place the name of "The Valley of Death."

It was reported that the Austrian general commanding the defense watched some of his men being disarmed after the battle. Presently the Austrian standards were brought up from the gorge. At this sight, it was said, the Austrian general drew his revolver and shot himself dead.

On September 5, 1914 Austrian troops which had been stationed behind the Grodek Lake district passed the railway lines of Rawa-Russka and Horynier, and on the next day advanced to Kurniki. On the following day a heavy battle began between these forces and a strong Russian force advancing northward. Two days later the Austrians opened their offensive on a forty-mile front, having the better of the conflict until September 11, especially on the southern wing near Lemberg.

The Austrians then retired because of the necessity which had arisen for a new grouping of their forces, the north wing of their

army near Rawa-Russka being threatened by superior Russian forces near Krasnik and between Krasnik and the battle fields of Lemberg.

The attack by the Russians on the Opolie-Turobin section of the line seems to have been a powerful one and the Austrians retired southward, paralleling the course of the Vistula. For nineteen miles the Russian cavalry was engaged with the rear guard of the retreating forces. There was particularly fierce fighting at Suchodola and also at Krasnik. At Frampol, there was a strong Russian cavalry charge. From this point, the Austrians were forced back on the left into the morasses about Bilgoraj and the right and the center were crowded together as they drew near the San. By that time, Russia claimed to have sent 10,000 prisoners back to Lublin. These movements were all the first days of September, 1914.

CHAPTER LXVI

BATTLE OF RAWA-RUSSKA

DURING the time that Auffenberg's army had been retaining the position before Lemberg, a new line of defense had been instituted in his rear. This line ran from Grodek to Rawa-Russka, and thence along the railroad line toward Narol. As the Russian forces between the armies at Tomaszow had not as yet gotten as far as Tarnograd, the far left of Von Auffenberg's troops, or those of the Archduke, which were a continuation of Von Auffenberg's army at this point, were for a brief time almost in touch with the fringe of Dankl's army on its way to the San. But there was no combined and determined stand at any time. The entire army fell back, set upon getting across the river.

It is probable that on the line from Grodek to Rawa-Russka there were more than 1,250,000 men in the armies on both sides. The line was more than sixty miles long, but the struggle was

concentrated on certain points and fighting elsewhere was not important. The most critical points were at Grodek on the far south, where a position of considerable strength was occupied by the Austrians, and at Rawa-Russka.

One advantage which accrued to the Austrians was that they occupied positions which had been well fortified before the battle of Lemberg, probably in anticipation of a retreat. Nature, itself, protected their right at Grodek against a turning movement. They had excellent railway facilities in their rear. The advantages possessed by the Russians were those of numbers and the fact that they were encouraged by victory.

The battle had its beginning about September 8, 1914, round the position at Grodek, where the Austrians had retreated after the capture of Lemberg. It was on the extreme north of the line, however, that they first began to give ground. There they were not able to make any extended stand because the enemy, besides attacking them fiercely from in front, began to envelop their left.

The fighting went on over a large extent of ground. At several places, large numbers of Austrian prisoners were taken. The upper part of the Austrian line was forced steadily back, not without desperate fighting, and finally the entire line became doubled back on itself, at a sharp angle from Rawa-Russka. Here the fighting was terrific.

Rawa-Russka was a small Galician city, inhabited chiefly by Jews. The greater part of the town was old, but there was a modern settlement near the railway station, the town being one of the chief railway centers in that part of Galicia. There, two lines cross, one a branch of the main line to Cracow, from a point near Jaroslav to the frontier at Sokal, and the other extending northwesterly from Lemberg to the Polish frontier at Narol. There were at Rawa-Russka large railroad works, round-houses, sidings, and storage yards.

As the big battle began to develop on September 8, 1914, it was seen that Rawa-Russka was the place where it probably would be decided and the best efforts of both sides were exerted there. The defenses on the point of the angle of the Austrian line, just

behind which was the town, were in extent no longer than six, or at most eight, miles. Nevertheless, during eight days, there were as many as 250,000 or 300,000 men engaged here in night and day fighting.

After the first two days, the Russians concentrated their attack on the very apex of the Austrian angle, atop the bluffs at the edge of the ten-acre battle field. During eight days, the Russians stormed this point repeatedly. In a single mile the Austrians made no less than eight distinct stands.

Some points before being evacuated were taken and surrendered several times, and then retreat was only for a short distance, followed by just as determined resistance. The courage and determination of both armies was equally admirable.

One position held by Austrians for hours was in a stubble field. It was necessary to hold this point while a better position was being dug a few hundred yards behind in a slight dip in the ground. The rain of shrapnel was so heavy about this place that later it was not possible to pick up a handful of dirt from it without finding therein pieces of lead. For a mile across the field where the Austrians had lain, bloody bandages and pieces of equipment were strewn thickly.

Behind this line, two or three hundred yards, was another line just beyond a small ground swell, where the Austrians placed themselves in fairly deep trenches. The Russians took this trench, but being unable to advance farther, dug themselves in on their side. The next day they were driven out by the Austrians. Afterward the trench presented the strange appearance of a ridge of earth with a trench on each side—with Austrian relics on one side and Russian relics on the other.

Day by day the Russians drove the Austrians back farther, until at last, the Austrians were holding a deep trench on the slope of the crest of the last ridge of hills defending the town itself. Immediately over the ridge the Austrian batteries were concentrated. The last trench was not more than four hundred yards in front of the Russian guns.

Nevertheless, the Russians were unable to make any advance against this position until they brought up and put into position

a considerable number of heavy howitzers. Then slowly, they began to crumble the Austrian defenses. Notwithstanding this bombardment, the Austrians held on for more than a day. Then the Russians stormed the entire top of the hill and seized the few guns which they had not already put out of commission. The hill was taken at the point of the bayonet. This was the decisive moment in the whole conflict.

From the center of the field where this action was taking place the Russian wedge extended to the north and south. The Austrian center was broken when night fell and the Russians were dropping shells into the outskirts of Rawa-Ruska. Attacks by the Russians followed, making it impossible for the Austrians to hold the town and it was abandoned by the Austrian forces. In any event it soon would have been enveloped in the rear, considering the way events were shaping themselves on the southerly end of the line, and the defense would have been costly.

CHAPTER LXVII

RUSSIAN VICTORIES—BATTLES OF THE SAN

EARLY in September, 1914, the Russians attacked strongly fortified positions at Grodek. This was during the time when the Russian northern army was busy driving back the enemy from Frampol to Biloraj. The defenses of Grodek, which included the position at Sadowa-Wisznia, were protected by a chain of six lakes and considerable ground cut up by dikes.

The Russians were commanded by General Brussilov, who duplicated here the tactics of continuous and heavy attack with which he had overcome the resistance of the Austrians at Halicz.

The Austrians had taken stand on a group of heavily wooded hills. In order to reach this, the Russians were obliged to cross a plain about three miles wide, in a series of parallels, while subjected to fire from machine guns and rifles.

It was not until three days later that they were able to gain a position where their guns could reach effectively the trenches of the Russians. When the assault was made with bayonets, the trenches were found heaped with bodies. According to the Russians, the prisoners they took said they had been without regular food for many days and had subsisted on raw potatoes and wild pears. Continually harassed by the Russians, they had not time to bury their dead and so the living had fought on while the remains of their fallen comrades decayed beside them.

A brief account of the affair from the Russian viewpoint is contained in the announcement from the Russian Headquarters Staff, made September 14, 1914:

"The army of General Brussilov, against whom the Austrians made their last desperate onslaught, has on taking the offensive, captured many guns, prisoners, and artillery parks, the numbers of which are now being reckoned. General Brussilov testifies that his troops displayed the highest energy, stanchness, and gallantry. The corps commanders calmly and resolutely directed their troops and frequently wrested the victory at critical moments. General Brussilov specially mentions the distinguished services of General Radko Dmitrieff."

There is no doubt that the engagement here referred to was one of the most bitterly and desperately contested of the war. But the conflict on many fields was being conducted on a scale so huge that it loses much of its importance in a general survey. On the day following the announcement just quoted, the Grand Duke Nicholas briefly announced that "the Russians, after occupying Grodek, reached Mocziska, and are now within one day's march of Przemysl."

While Brussilov's center was moving on to Mocziska, which is about forty miles west of Lemberg, his left was advancing southwesterly along the railroad line to Sambor, and on to Chyrow. The latter place, however, was not taken until September 24, 1914. The fortress of Przemysl was thus cut off from the south.

When Grodek fell, Brussilov's soldiers had been marching and fighting without pause for longer than three weeks. The feats

of endurance they had performed were extraordinary but without delay they pursued the Austrians from Grodek with the same alertness that they had shown in following them from Halicz.

In the meantime, as we have noted, Rawa-Russka had been taken. Like Brussilov, Russky was not inclined to give an enemy he had bested any chance to recuperate, and while Brussilov was pursuing the Austrian right from Grodek to Chyrow on the south of Przemyśl, Russky was following up his success with equal vigor, driving toward Sieniawa the shattered forces which had opposed him.

Sieniawa was occupied on September 18, 1914, the same day that Brussilov took Sambor. Jaroslav was captured by assault on September 21. There was hard fighting on the way there, around Javorow, fifteen miles east of Przemyśl, where the Russians claimed to have taken 5,000 prisoners and thirty guns. In such wise was Przemyśl cut off on the north, east, and south. Behind its defences, what was left of Von Auffenberg's army took refuge.

The Austrians also had met with reverses where Dankl's army had been falling back before the troops of Generals Ewerts and Plehve. It has been shown that the continuity of the Austrian defenses had not been effective in the region northwest of Rawa-Russka, though it extended beyond the frontier between Tomaszow and Tarnograd. After the conflict at Tomaszow, the line of the Archduke Joseph Ferdinand above Rawa-Russka to that place had been bent back on the Rawa-Russka-Jaroslav railroad, while the main body of Dankl's troops fell back on the line of the San.

Never was the Russian pressure on its rear relaxed. The pressure was especially strong from the Russian right which had fought the battle of Krasnik, after clearing the Opolie-Truobin district. The larger portion of the Austrian troops crossed the San near its junction with the Vistula. Probably they hoped that while they might place themselves, on the other side, in touch with the Austrian railroads, the river would be a barrier behind them against the Russians.

It appears that General Dankl, anticipating the necessity of falling back across the San, had been sending his transports back in advance of his retreat, almost from the time the retreat began. In fact, some of the transport trains had been sighted and subjected to shell fire as early as September 9, 1914, from the left bank of the Vistula. Not until September 12 did the army itself reach the banks of the San.

Two heavy rear guards, to north and east, were left to hold back the oncoming Russians, while the main body and the baggage were crossing the river on September 12. The Vistula protected the left of one of these rear guards, the San protected the right of the other. Thus the two formed an arch between the two streams.

Marshy ground made difficult the attack on their front, but, nevertheless, they seem to have been unable to prevent the Russians from piercing the screen before the crossing of the river had been completed. There was great slaughter. The Russians claimed that they took 30,000 prisoners. The artillery of the Russians was highly effective in shelling the bridges while the Austrians were passing over them in solid masses. Beside the large number of those killed by shell fire, many were reported to have been forced into the water and to have drowned.

Neither was there respite for the Austrians on the other side of the river, although, in theory, the forcing of the passage of the San by an invading army was considered an impossible task. Enormous sums had been spent by the Austrians in an attempt to make it impregnable.

Along the upper or southern part of its extent it was protected by the powerful position of Przemysl and by Jaroslav. From there, a light railroad, which had been built solely for strategic purposes, ran parallel and close to its left bank almost to the point where it joined with the Vistula.

As they retired, the Austrians destroyed bridges behind them. But they were not able to destroy all, otherwise a few days' rest might have been vouchsafed the First Army. By quick work the Russians seized and maintained a hold on the bridge at Kreszov, on the frontier a few miles west of Tarnograd. As

an official communiqué from Petrograd put it: "The Russians leaped across the river on the very shoulders of the retreating enemy."

The victory on the San, September 12-19, 1914, may well be considered one of the most important of the campaign. There is no way of estimating the Austrian losses, over and above the 30,000 prisoners the Russians say they took, but they probably were heavy. Still more important was the fact that the Russians had broken down the barrier which the Austrians had sought to put between themselves and the invaders. Save for the fact that the Austrians were now in touch with their railroads, and for the moment within reach of security, being under the shelter of Cracow, their position within the triangle formed by the Vistula was no more safe than it had been when they were above it.

The Russians reported that within that triangle they seized an enormous amount of supplies of every kind. Moreover, with the advance on Krzeszow, the last of the invading Austrians had been forced from Russian soil. No longer was an enemy left in the provinces of Podolia or Volhynia.

It must be recalled also that Russian troops which were based on Ivangorod also had intercepted German reinforcements on the left of the Vistula as they hastened across Poland to the aid of Austria. The guns of the Russians also had shelled the transports of the Austrians as they retired along the right bank. The Russian right, pressed on the retiring Austrians, had been able to spare a large number of troops, and these it had thrown across the Vistula at Josefow. These, acting as reinforcements of the Russian troops already on that side of the river, had hurried southward, paralleling the advance of the main army on the right bank and brushing aside whatever forces of the enemy they met.

In this way they were able to prevent any help from that quarter coming to the Austrians. Also, when their comrades were delivering a final blow to the Austrians at the crossing of the San, they were busy on the opposite side of the Vistula driving back a large Austrian force and occupying the important place of Sandomierz. They encountered and overcame near Sandomierz

the Second German Landwehr Corps under General Woirsch. In the neighborhood of and at the town they reported that they had taken 3,000 prisoners and 10 guns.

CHAPTER LXVIII

SUMMARY OF OPERATIONS OF SEPTEMBER, 1914

LET us now briefly summarize the Russian strategy during this month of portentous development, September, 1914, which concluded with the advance down the left bank of the Vistula and the occupation of Sandomierz.

It will be recalled that, being more or less prepared, Russia had found herself invaded by armies operating in three different directions over an extended front. These armies contained in all about a million men. The weakness of this advance, the Russians saw, consisted in this: that the farther two armies of invaders, advancing in divergent lines, proceed, the farther they become separated. Thus it is more difficult for them to act in harmony or for either to protect the flanks of the other.

For this reason the Russians were satisfied to allow the First or northern Army of the Austrians to advance almost without resistance until it came within artillery range of its first main objective—that is Lublin and the railway line to Ivangorod and Warsaw.

Then the Russians delivered a blow with force at the weak point between the two invading armies in the vicinity of Tomaszow. The Austrians, to meet this attack, were obliged to withdraw their reserve forces from the far left across the rear of the First Army. When these forces proved inadequate, the organization of a new army began, and this was thrown into the gap.

If it had been advanced immediately and simultaneously with the other two armies, the new army might have served its pur-

pose, but the campaign, it seems, was already too far advanced. The strength of the Russians had been augmented, and after they had driven the wedge in at Tomaszow they retained it in place, and were able to widen the break by means of the operations which followed in the vicinity of Bilgoraj, and by driving back the Austrian forces above Rawa-Russka. In this way the First Austrian Army was left dangling at the extreme of its advance.

In the meantime Brussilov had made his well-planned turning movement along the Dniester on the far south, and had delivered his blow on Halicz. Russky at the same time was hammering at the Austrian front and left, penning in Von Auffenberg's army on an ever-contracting front, and throwing it back on its successive lines of defense on the Złota Lipa before Lemberg, and from Grodek to Rawa-Russka.

The Austrians, pushed back from each of these, and with Cossack cavalry on their right, ranging over a considerable extent in southern Galicia, were forced to fall back, guarding as best they might their rear, westward toward Cracow.

When Von Auffenberg's army had been put in a tight place, busy taking care of its own safety, the Russians were able to devote their attention to the army Dankl had in the north. There was no chance of aid reaching it now, and it was weakened from efforts to force the barriers that had been put across its path.

The chief strength of the Russians was massed against the left of this army, for if that wing was broken the entire army would find itself hemmed in and must retreat in order to avoid being surrounded. And so, forced from Opole along the Vistula, attacked constantly on its entire front and right flank from Tomaszow and Tarnograd, Dankl's army was forced down to and across the San and beyond it.

The movements of the Russians had been executed with great harmony. By September 23, 1914, Dankl's army had been driven by Ewerts and Plehve to the line of the Wisłoka. Jaroslav was taken by Russky on September 21. Chyrow was possessed by Brussilov on September 24. Brussilov had entered Galicia at Woloczysk on the same day—August 22—that Russky had crossed the frontier and occupied Brody.

The Austrian losses, since the taking of Lemberg, according to an official statement made by the Russians on September 17, 1914, were 250,000 killed and wounded, and 100,000 prisoners with 400 guns, many colors, and a vast quantity of stores. We are not obliged to accept these figures. They are given here for what significance and merit they may have, but as coming from Russia. It was also reported by Russia that the rifles taken numbered almost half a million. The enemy's total losses were put by Russia at from 35 to 50 per cent. Even the small estimate is said by Austria to be an exaggeration.

The Russians now held all eastern Galicia, and were masters of Lemberg, Jaroslav, Brody, Busk, Tarnopol, Grodek, Brzezany, Sambor, and other towns of no little importance, and also of the railroads between these towns. They also were in control of the oil fields of Galicia, of considerable importance to them at this time, and of the valuable agricultural resources of Galicia, or of such part of it as they occupied. Przemyśl alone held out. Russian cavalry was already trying the approach to the Carpathians from the Dukla Pass to the Bukowina.

CHAPTER LXIX

INVESTITURE OF PRZEMYSL

MANY fortresses lost a reputation of long standing for strength during the Austro-Russian campaign. Grodek and Rawa-Russka, with fine natural defenses and excellent works, were carried by assault after gallant resistance. Lemberg's defenses were reputed to be powerful, but no attempt was made to utilize them. The fall of Jaroslav has never been explained. It was considered generally to be stronger than Namur or Liege, and a prolonged resistance was anticipated there. It withstood attack for only two days. When heavy guns were brought to bear on it by the Russians the garrison withdrew. Przemyśl seems, alone of all the Austrian defenses, to have justified its reputation.

Przemysl was not only a strongly fortified place but a beautiful city as well, surrounded with flower gardens and orchards. Its history, like that of Lemberg, had been a stormy one. Its population in 1914, including residents of its suburbs, was about 50,000, principally Poles and Ruthenes, who lived together in amity and great religious toleration. In September of that year, when the Russians made their whirlwind advance, there was, according to official reports from Vienna, an army of 80,000 based on the city, under the leadership of General Boveerig.

With a large part of this army, Boveerig was reported to have moved to the line of the Wisloka to give aid to Dankl's hard-pushed troops as they made their stand on that river. It was understood that many of Von Auffenberg's soldiers, as they fell back, were employed as a garrison for the fortress. At the time of its investment it was said to contain about 100,000 men, with its defense in charge of General Kusmanek. Afterward the strength of the garrison was increased.

It has been indicated previously how the railway communications had been broken on the east and south by the advance of the Russians after the fall of Grodek and the taking of Mocsiska. The isolation of the fortress of Przemysl was completed by the fall of Jaroslav and the occupation of Radymno, a town on the main Cracow railway on the left bank of the San, about eight miles east of Jaroslav and fifteen miles north of the fortress. And so it remained isolated, save for a short period when the tide of invasion was driven back. During this time it was again in communication with Cracow.

The Russians took it as a matter of course that the fortress would soon fall to them. Its fate was predicted in the newspapers of the Allies; but, in preparation for defense, stores of all kinds had been hurried into it, and plans had been laid for stout resistance. It had a determined commander in General Kusmanek.

The first shots were fired on September 18, 1914. The city was surrounded on September 20, and an unbroken bombardment with many desperate sorties ensued until October 2, when the Russians sent out a white flag to the city and demanded its

surrender. General Kusmanek's reply was that he would not discuss surrender until he had exhausted all powers of resistance. The attack reached its height on October 5, 1914. The Russians stormed again and again, hills of corpses outside the works testifying to furious attacks they made. They succeeded in carrying temporarily one of the outer works, eleven battalions having succeeded in approaching these defenses undetected, because of damage to an Austrian searchlight.

Suddenly they stormed the walls. The garrison retreated to the casemates, from which they defended themselves with rifles and machine guns. The Russians forced their way to the casemates and a hand-to-hand struggle with bayonets, gun butts, and hand grenades followed. When Austrian reinforcements, hastily telephoned for, arrived, the attacking party was already retiring, leaving their dead and wounded in the casemates and on the wall. Rockets and light shells illuminated their retreat. There was desultory fighting during several days thereafter, and then the Russian army settled down to a routine investment, biding the time when their heavy siege guns could be brought up and the way made ready for an effective assault. On October 18, 1914, there was a battle to the east of Chyrow and Przemyśl, which was successful for the Austrians. The fighting near Mizynico was especially severe. The Magiera Heights, which had been in the possession of the Russians, were occupied by the Austrians after a formidable bombardment by their artillery. At the same time Russian attacks on the east of Przemyśl to Medyka Heights, on the southern wing of the battle field, which were especially directed against the heights to the southeast of Stryl and Sambor, were repulsed. A fresh attack of the Russians on the east bank of the river near Jaroslav also was repulsed.

The addition of reserves and the opportunity to reorganize their army, gave new fighting force to the Austrians about this time. Wherever the Russians retired they followed them closely and by reconnaissances were able to develop weak points in the Russian positions. On October 20, 1914, the Austrians had gained ground in several spots in a heavy, stubborn attack on the fortified positions of the Russians from Plotzyn to the highroad east

of Medyka, while a Russian counterattack was unable to make headway.

On the heights north of Nizankowice, Austrian troops scored another victory and took also the villages situated against the heights. In the southern wing the battle was carried on mainly by artillery. The modern field fortification system being liberally used by the Austrians, and the battles had largely the nature of fortress warfare. On the same day the Austrians captured in the Carpathians the last point, Jablonki Pass, held by the Russians.

Thus we now see the Austrian army, which had been described as routed and destroyed in battles in Galicia, seemingly taking on a new lease of life, although appearing to have found an impenetrable barrier at the River San north of Jaroslav. On October 22, 1914, the Austrians retook Czernowicz, capital of the crownland of Bukowina, which had been in the possession of the Russians since early in the war. They also captured two field fortifications, situated one behind the other, to the southeast of Sambor.

For eight days a terrific fight was waged between the Russians and the Austrians on the line from Sambor, along the River San to Przemyśl and Jaroslav, and then to the southward. The battle extended over a front of about sixty-five miles. The cannonading was uninterrupted. The Austrians had started the attack at Sambor but were thrown back by vigorous Russian counterattacks. A concentration of Austrian corps then attempted an advance against Lemberg, with the intention of bisecting the Russian line. This attack was defeated with losses.

On October 31, 1914, the Austrians defeated a mixed Russian column near the Galician-Bukowinian frontier, north of Kutu. In middle Galicia by that date they had occupied Russian positions northeast of Turka, near Stry, Sambor, east of Przemyśl, and on the lower San. Several Russian attacks around Lisko were repulsed. At Lisko, Stry, Sambor, and other points, the Austrians took many prisoners. Near Stry and Sambor the Austrians blew up a Russian ammunition depot.

On November 1, 1914, the Austrians claimed that they then had interned in Austria-Hungary, 649 Russian officers and 73,179

Russian soldiers, not including the prisoners they had taken in the fighting in the district northeast of Turka and south of the Stry-Sambor line. The fighting in this locality was renewed with greater intensity by both sides early in the month, fortune favoring first one and then the other. On November 2, 1914, two infantry divisions and a rifle brigade of Russians were dislodged from a strongly intrenched position.

About this time the czar's forces began concentrating their main attack northeast of Kielce in an effort to repeat the tactics by which they won important victories over the Austrians in the first days of the war. It was their plan, provided they were able to break through at this point, to turn southward against the rear of the Austrian army in Galicia, just as they did two months before, after the battle of Rawa-Russka.

The line of battle in the southeast now became more definitely outlined, extending from Turka through Nadworna and Kolomea to the Russian border just east of Czernowitz in Bukowina. The renewal of Russian attacks followed the bringing up of a new levy of reserves.

The Russians now advanced with fair success along the whole Vistula front. They secured Piotrkow and other places in such positions as to suggest that the Austrians were running the risk of being cut off from Cracow, their ultimate goal of retreat. A rear-guard defense was attempted by the Austrians at Opatow but without success, and the Russians took several hundred prisoners and six Maxims with a supply train.

On the San River, where the fighting had been severe for a fortnight, the Russians adopted the method of deliberately sapping their opponents' trenches, precisely as a besieging force saps its way toward a fortress. This proved a success. When the Russian sap burst in the trenches the Austrians retreated, and the Russians, taking advantage of the confusion, stormed the fortifications in the neighborhood and took them, capturing 5 officers, 500 men, and all the Maxims.

An Austrian column which had descended the north slope of the Carpathians in the direction of Narvoda, where it had intrenched itself, was attacked and driven back. This operation,

being removed by more than one hundred miles from the nearest point to the great struggle, indicated that the Austrians, confident of victory, sent forces across the Carpathians to catch the Russians in the rear when the proper moment came.

This moment, it seems, failed to arrive, and the Russians, having the support of the native inhabitants, had little difficulty in dealing successfully with successive isolated attempts of the considerable Hungarian reserve bodies sent across the Carpathians at various points.

There was some activity about this time before Przemyśl, which several times had been reported, incorrectly, as having been taken by the Russians. An attempt was made by the garrison at a sortie. The Russians allowed it to proceed until they could cut in behind, when the force was surrounded. When it found it was impossible to cut a way through either forward or backward, it surrendered. The Russians took about 2,000 prisoners.

On the Austrian retiring line from Kielce to Sandomierz the Russians succeeded on November 5, 1914, in breaking down the defenses of the enemy, and in stimulating a more or less orderly retreat into a hasty flight. Sandomierz, itself, an exceedingly important strategic point, which had played a vital part since the early days of the war, fell into the hands of the Russians. In fighting with the Austrian rear guard southward of Kielce the Russians took within a week 200 officers and 15,000 men prisoners, with scores of guns and Maxims.

CHAPTER LXX

AUSTRIAN RETREAT BEGINS

AT this time the Russians were strongly established on the six-mile front of the left bank of the San River, between Nizko and Rudnik. The Austrian opposition there had been long and determined, but was finally broken early in November, 1914. The Austrians began a retreat along this front.

This retreat was such as to indicate less a general defeat than a general obedience to orders to withdraw. It is true that the Russians had been pressing with great energy upon the upper Vistula and San fronts, especially since the settlement of the main fight farther north against the Germans and mixed forces, but the Austrians were in possession of strong fortified positions which still were giving trouble to the Russians, in spite of their constantly increasing numbers.

It was now plain that the Russians had left the Galician front until the Vistula front had been cleared, when a proportion of the troops released there could proceed to add to the fighting force in Galicia, thereby causing the retreat of the Austrians along the whole front.

On November 5, 1914, the Russians achieved what the General Staff characterized as "the greatest victory since the beginning of the war." This was the recapture of Jaroslav. It was announced to the Allies by Grand Duke Nicholas in a formal message, which also stated:

"Following our successes upon the Vistula, a complete victory has just been gained by our troops along the whole of the front in Galicia. Our strategical maneuver has thus been crowned by what is incontestably the greatest success gained on our side since the beginning of the war. I am most confident of the speedy and entire accomplishment of our common task, persuaded as I am that decisive success will be gained by the allied armies." In the capture of Jaroslav the Russians took 5,000 Austrian prisoners.

During several days before the general Austrian retreat along the Vistula front began, they were engaged in furious attack, their artillery fire being especially severe. It was evidently a supreme effort. The last engagement was over an extended front, enormous forces striving to prevent the Russians crossing the San at a point near Monastryzek. It was reported that reinforcements pushing over the Carpathians in an attempt to aid them were delayed in the snow-filled mountain passes.

We will have a better understanding of Russian tactics as worked out in the activities just referred to, if we consider here

an official statement issued by the General Staff about this time concerning them. It read:

"Fierce combats on the River San and south of Przemyśl, which have been going on for more than three weeks, resulted on September 5, in the general retreat of the Austrians.

"On the preceding night, the Austrians made a last effort to repulse our troops who were crossing the San. Until a late hour, the enemy attacked on an extended front, taking the offensive in dense, successive lines, but everywhere they suffered enormous losses and were repulsed.

"On November 5, 1914, the enemy's columns commenced to move from the San in the direction of Dukla Pass across the Carpathians and south of Przemyśl, seeking everywhere to leave the battle front. We pursued them energetically, all along the line.

"The abandonment by the main Austrian forces of the line of the San is the result of the victorious battle fought at the end of September, the original purpose of which was to block the offensive of the Austro-German armies against Warsaw and Ivan-gorod.

"At the beginning of October our troops were engaged along a front extending for 330 miles and passing through Warsaw, Koziennica, Przemyśl, and Czernowitz. Toward October 20, we succeeded in gaining a decisive victory on the left bank of the Vistula in the region of Warsaw.

"Following up our successes during the last eighteen days, on a front of 330 miles, we broke the resistance of the enemy who is now in full retreat. This victory enables our troops to proceed to a realization of further tasks to inaugurate a new period of the war."

This announcement is embodied here, not only for such information as it contains which coincide with established facts, but that the Russian viewpoint toward such events and the purpose behind Russian activities may be manifest.

To the south of Przemyśl on November 7, 1914, the Russians having increased their activities in the region considerably, took 1,000 prisoners. Warfare about the fortress now seemed to be entering a new phase, which the Russians initiated with great

artillery activity and an advance against Medyka. The Austrians responded with a closer concentration, with the fortress as their center. After the first seizure of Przemyśl, all damage to the fortress had been repaired and the outer forts strengthened by field fortifications, of a very strong character, and covered by battery positions.

A new railroad bridge was built at Nizankowice and communications with Chyrow, about twenty-five miles to the south, restored. Numerous trains had been used to transport wounded soldiers and useless Przemyśl civilians southward and to bring back flour, Zwieback, and other supplies to the fortress. The arrival of many carloads of beer caused particular rejoicing.

On November 11, 1914, the Russians advancing on Cracow from the direction of Jaroslav, occupied Miechow and Dynow. The forces operating further south seized Lisko. It now seemed to the Russians that the enemy would not be able to make an effective stand east of Tarnow and the Donajec River and so the Russians would find themselves once more on the lines they had been forced to abandon hastily six weeks previously, when the Germans first made their rapid advance to the Vistula. This was as a result of this campaign and the course of the Russians in conceding smaller successes in order to concentrate their forces at the most important point, that the Austrians found themselves driven back now at every point, while the Russians advanced for the possession of the western part of Galicia. It was the hope of the Russians that their advance in Galicia would soon set free their Cossack divisions for a new invasion of Hungary.

On November 12, 1914, the Russians sustained a defeat near Czernowitz, capital of the Austrian province of Bukowina. The Austrians made an unexpected movement, crossing the Pruth, a few kilometers north of Czernowitz and suddenly attacking the Russian right wing. The Russians were completely surprised and after a short resistance, decided to fall back upon their base, which seemed free. However, they were then taken under fire by Austrian artillery, which caused great losses among the Russian detachments. The battle field was strewn with corpses. Russian

forces in the Stryl valley also were forced to retire with heavy losses by a surprise attack from an Austrian armored train and Austrian cavalry.

The Russian offensive in Galicia toward Dounaietz nowhere encountered resistance. The Russians occupied Krosno and inflicted heavy losses on the Austrian rear guard.

It should be noted that during the middle of November, 1914, the campaign on which the Russians were concentrating their attention was against the Austrians. The Russian campaigns had consistently adhered to the principle that in military operations important results are obtained by bringing every force to bear upon a single point until the desired end is accomplished. The Russians still followed this policy.

The operations in East Prussia and in Western Poland were for the time being made secondary while all energy was devoted to pushing forward the campaign against Cracow. When they were now within fifteen miles of it, an appeal was sent by the city to the Germans for reenforcements. The civilians of the place removed themselves from the fortified area and the inhabitants generally fled the locality. The German colony left for Berlin and Bavaria.

Cracow was surrounded by a triple line of fortifications of which the outer line contained fifteen forts, eleven on the north, and four on the south bank of the Vistula. The defenses on the north were much stronger than those on the East, where the San River and the fortresses of Jaroslav and Przemyśl were once regarded as a secure barrier against Russian advance. The Russians already had broken down that barrier and only two small streams lay between their eastern army and the last stronghold of Galicia.

On November 15, 1914, the Austrians defending Przemyśl again attempted a sortie, this time with greater success than before. It forced back the Russians on the north side of the fortress to the heights of Rokietnica, with small Austrian losses. A second sortie was repulsed by Russian artillery and cavalry and heavy losses inflicted on the Austrians.

In Galicia we now find the Austrians west of the Donajec

River, along the front from Tarnow to the Vistula. The Austrian line then followed the Biala River for a few miles until it cut across to take advantage of the Wisloka, north and south of Jaslo. From there east the Austrians were retreating into the passes of the Carpathians.

These latter troops were relatively small bodies, whose main object was to prevent the Russian cavalry from making raids into Hungary. Opposite Tarnow, the Austrians were prepared to put up a most stubborn resistance, for they regarded the holding of this part of their line as essential. Unless they could hold back the Russians there, they reasoned, the latter would have a chance to break through and cut off the Austrian army that was retreating from Sanok and Jaslo. A Russian advance north of Cracow, they figured, would tend to cut off the entire Austrian army from its German Allies. This was an object for which the Russians were striving.

Abandonment by the Austrians of Central Galicia and the gathering of their armies toward Cracow soon began to show results in the stiffening of their resistance to Russian advance. As the Austrians retreated westward, their front decreased in length with consequent strengthening of their line. It was their desire that this strengthening should enable them to extend northward along the Warthe River, thus freeing some of the German troops for service in the army that was advancing from Thorn.

By the Russians, a German advance in considerable force along the narrow battle front on the west bank of the river Vistula was regarded as a feint at the city of Warsaw, the intention of which was to draw Russian troops from their advance upon Cracow and distract attention from efforts to establish a strongly fortified defensive line from Kalisz to Cracow.

CHAPTER LXXI

FIGHTING AT CRACOW

ON November 20, 1914, the Russians were before the outer line of defenses of Cracow, with strong opposition to their further advancement. Meanwhile, they were pushing forward minor columns of Cossacks into the passes of the Carpathian Mountains, intending that these should emerge, if possible, upon the Hungarian plains in raids similar to those which were made in the first Russian advance in September.

During the next few days following November 20, 1914, there was constant and hard fighting in the vicinity of Cracow, the Austrians reporting that they had taken three battalions of Russians prisoners. All reports showed a stiffening of the Austrian line, while the energy of Russian attacks was reduced by the diversion of troops to stem the Russian invasion by way of the Vistula.

The Austrians were obliged, however, a few days later, to evacuate Neu Sandec, fifty miles southeast of Cracow, and an important railroad junction of the River Donajec and the main line to Cracow. The Russians reported they took 3,000 prisoners and some machine guns. The capture of Neu Sandec revealed a new Russian advance, threatening the right flank of the Austrian army along the Carpathian Mountains. By this capture the Austrians were deprived of an important railway into Hungary. In order to stop this turning move, it was necessary for them to weaken their campaign north of Cracow.

In the Cracow region, the Austrians advanced on the north to Pilica, Wolbrom, and Miechow, about twenty miles from the Galician border. To the east, the Russians advanced to within twelve miles of the fortress. In the fighting at Pilica and Wolbrom, the Austrians claimed the capture of 29,000 Russians.

In the latter part of November, 1914, the Russians were successful in attack in Galicia along a line from thirty to sixty miles

southeast of Cracow, taking more than 7,000 prisoners, thirty cannon, and twenty machine guns in one engagement. On November 29, 1914, the Austrians also scored a victory on the front extending from Proszowicz to Onszreniawa, fourteen miles northeast of Cracow, southward through Brzesko on the Vistula to Bochnia and Adsniez.

At Radko, General Dmitrieff's cavalry began a pursuit of the Austrians, who were planning to slip out behind Cracow toward Vienna in order to re-form. Part of the Austrian troops defeated on the San had retired beyond the Carpathians to recuperate while the Russians energetically attacked the Austrian force defending passes to the southeast of Cracow.

At this stage of hostilities, the Russians estimated that the Austro-Hungarian casualties had amounted to 19,000 officers and 900,000 men. At the same time, it was estimated by the Austrians that the total Russian losses had been 760,000 in dead, wounded, deserters, and prisoners. Of these, 420,000 were attributed to the various battles against the Austro-Hungarian forces, and 340,000 to battles against the Germans.

The losses of the Russians in the campaigns against Austria-Hungary, as estimated for the various engagements, were as follows: Early raids, skirmishes, and frontier fighting, 15,000; Krasnik, Niedzfica Duza, Lublin, 45,000; Zamosz, Komarow, Tyszowce, 40,000; first battle of Lemberg, 45,000; second battle of Lemberg, 30,000; Rawa-Russka, Magierow, 30,000; offensive against middle Galicia, 15,000; offensive around Przemyśl, 40,000; raising siege of Przemyśl, 15,000; Carpathian invasions, 30,000; battles on the San beyond Przemyśl, to date, 25,000; Medyka-Stari, Sambor, 40,000; outposts in the Carpathians, 15,000; last battles of the Vistula from Sandomierz to Ivangorod, 35,000.

On December 1, 1914, the Austrians had been driven from all their positions over a front about thirty-three miles long, which defended the Carpathian passes from Konecha Village, twelve miles north of Bartfield eastward—that is, on all roads leading through the Dukla Pass over the Carpathians. This was the lowest pass anywhere available across the mountain range and

being also the widest, is in all respects best suited for military purposes. All armies that previously had invaded the present area of Hungary from time immemorial, via the Carpathian Mountains, had used the Dukla Pass.

A number of points along the line mentioned, where the Austrians had established defensive positions, were taken by the Russians, the most easterly being south of Mezolaborez. All were taken by assault. Many guns, Maxims, and prisoners were captured. An energetic Russian advance continued to push the Austrians back toward Cracow. The Austrians evacuated one position after another with large losses.

The Russian advance toward Bartfeld and Hammona, on the south slope of the Carpathians in Hungary, indicated an attempt to push forward a turning force around the south flank of the Austrian position, as it stood at that time. The damage caused by this raiding expedition was calculated to force the Austrians to meet it and so divert them from the main fighting line at Cracow. Evidence of this shift was shown in a reverse which the Austrians administered to the Russians at Hammona.

Early in December, 1914, Russia replied to reports that she was suffering from a shortage of recruits by declaring she could put two corps against every one that Germany brought into Poland and still have enough to carry on the campaign against Cracow as originally planned. Her two armies operating against that important objective point had linked flanks. Investment of the city was daily feared.

The southern army, which moved directly west on the Tarnow-Cracow line, had fought its way over every inch of the ground, making a record of forty-five battles in forty-five days. At least, according to old measures, these fights would be classed as battles. Under the stupendous conditions which surrounded this modern cataclysm, they probably range as little more than reconnaissances in force.

Back to the banks of the River Raba, the advancing Russians pushed the Austrian foe. Here in a position of considerable defensive value, the enemy made a determined resistance. But the Russians swept on. The Austrians made a stand soon afterward,

outside the protecting radius of the fortress guns, in the angle made by the Raba and Schreniawa.

Przemysl about this time was reported to be in dire straits. Monsignor Joseph Sebastian Felczar, Archbishop of Przemysl, said, December 8, 1914, after he had left the city for the Vatican:

"Would to God my cathedral city might be spared the horrors of invasion but I feel I can hope no longer. Our garrison has resisted with stubborn heroism but the Russians outnumber them two to one. I got away only after long hours of wearisome wanderings across the Russian lines; the Muscovites had then already captured several of the outer ring of forts, besides other important vantage ground, and had hemmed round the whole fortress in a circle of steel.

"When I left Przemysl, indescribable desolation reigned there. The houses, palaces, and public buildings were reduced to dust heaps. Despite severe measures taken by the authorities brigand bands prowled among the ruins and pillaged such of the civil population as still remained. A never-ending procession of caravans traversed the streets, which were chock full of wounded and dying. The hospitals were overcrowded and the injured laid out in rows in the churches."

On December 4, 1914, the Russians, by the capture of Wieliczka, gained another step in their campaign for the possession of the broad passes to the south and west of Cracow. Wieliczka is a small town, about nine miles southwest of Cracow and three miles from the line of forts. It is built over salt mines, a short railway bearing the product thereof to the larger city.

On the northwestern side, the Russians were only a few miles from the city. It was only the Austro-German army, sitting in trenches and making occasional attacks on the Czenstochowa-Oilusz-Cracow line that prevented the complete encirclement of the place. The contest between these forces was mostly a slow artillery duel from day to day.

It was now the turn of the Germans to relieve the Austrians, if they could, from a critical position. For months before, the Austrians had been sacrificed in the interest of the German plan

of winning a crushing victory in France, and during the retreat from Warsaw it was the Austrians who bore the brunt of the fighting as a rear guard. Again, when the Germans found themselves hard pressed between the Warthe and the Vistula, they flung the Austrian reinforcements to fresh defeat at Wienun.

It was the contention of Austrian military experts that in order to maintain an effective resistance to the Russians at this time and afterward, the Germans should continue to withdraw troops from the western front.

The Russians seemed to feel secure at this time in holding back the German forces in Poland and so were passing forward their campaign in Galicia, in an effort to interpose a wedge between the forces of the opposing nations.

Russia also had a special motive for exerting every effort to inflict some signal disaster upon the Austrians. It was only by such means that she could relieve the pressure on Serbia and thus save the smaller Slav state from being overrun by the victorious Austrians.

The Russian campaign against Cracow had been little effected by the fighting going on at Lodz. The Russian forces in the region of Cracow had a clear line of retreat, if retreat should be necessary, and were not needed for strengthening the resistance being made by the Russians at Warsaw, as troops from Central Russia could be moved to that threatened district by the available railroads, much more rapidly than armies could be sent overland from Cracow. The Russian forces in the vicinity of Cracow could best help in the defense of Warsaw, the Russian General Staff believed, by pressing their attack energetically and so keeping busy in that field a large force of Austrians and Germans.

On December 6, 1914, the defense of Cracow was stiffened by the arrival of a large body of German troops. All the magnificent trees which surrounded the place were cut down to afford space for the artillery and various new lines of fortifications and barbed-wire entanglements were constructed.

The Russians perceived a turning movement on the part of the enemy, south of Cracow, directed against the Russian left

wing. Russian reenforcements which arrived found that the bridge over the Donajec, near Kourove, had been destroyed, and that the heights on the left bank of the river were occupied by the enemy. Under a sustained fire by Germans, one of the Russian regiments crossed the Donajec at a ford. They made their way through ice water up to their necks and coming out on the other side, captured the heights by a vigorous assault. This assured and made safe the passage of the river by the other Russian troops.

On the following day, December 7, 1914, the Austro-Germans made an effort to counteract the advance of the Russians to Wieliczka, southeast of Cracow. By a dash toward Neu Sandek, on the headwaters of the Donajec River, the Austrians attempted to outflank the Russians and thus force them to retreat from their advance position.

The Austro-German forces occupied the valley of the stream Lososzyna, and the fighting front extended from near Wieliczka southeastward to the Donajec, about fifty miles in length. The Russian attack was successful, the losses inflicted upon the enemy, especially the German Twenty-fourth Corps, being very heavy. Several German heavy guns were knocked out, five field batteries were reduced to silence, guns and prisoners taken, and the Russians continued their attack.

In the next few days in December, 1914, events favored the Austrians. In West Galicia the south wing of the Russian army was defeated at Limanovo and compelled to retreat. The Austrians engaged in hot pursuit and took many prisoners. Austrian forces took Neu Sandec and again entered Grybow, Gorlice, and Zmigrod. The Austrians reported that the Russians had completely evacuated the Zemplin country.

A third incursion of Germans into Galicia was arrested by Russians on the very border of the province. Some maneuvering on the part of General Dimitrieff's corps sufficed to check the invading columns, although they crossed the Carpathians on a wide front extending between Wieliczka and the headwaters of the San River.

During the same week, the garrison of Przemyśl made a series

of attempts at sorties, but each time were driven back with heavy loss. The Russians captured several hundred prisoners and ten Maxims. It was learned later that increasing scarcity of provisions complicated by sickness was responsible for these tentative efforts to lift the siege. An unsuccessful attempt also was made by a force from the garrison to open the railway in the direction of Biercza, on the southwest.

It was asserted at Austrian headquarters that the total number of Russians captured by the Austro-Hungarians in Galicia within three days in the middle of December, 1914, was 38,000. After a battle at Limanowa, it was said, 26,000 were captured. The number of Russians killed was very large, according to report, 1,200 dead being found at Limanowa alone.

The problem of caring for prisoners had by this time become acute both for Austria and for Russia. According to the Russian Department of the Interior, which had charge of the maintenance of prisoners, there were then in Russia, exclusive of the Germans reported captured in operations under way in North Poland, 350,000 Austrian and German prisoners of war. Of this number only 100,000 were Germans, the rest being Austrians captured during the campaign in Galicia.

At Semipalatinsk, on the Irtysh River, near the borders of Western Mongolia, one small squad of Russian soldiers was serving as guard for 100,000 Austrian and German prisoners, whose prison walls consisted of four thousand miles of frozen steppes, separating them from the borders of their own countries.

The prisoners were brought by rail to Omsk, where they were embarked on steamboats for the thousand mile trip down the Irtysh River to Semipalatinsk. Here quarters were found for them in the big barracks erected for the mobilization of the Russian army and unoccupied since its departure for the front.

Every morning at eight o'clock the prisoners were released from the barracks and permitted to wander about at will. When they departed in the morning, they were told that unless they reported at the barracks by nightfall they would be locked out. At that time of the year, in such a bleak country, this would mean death, as there was practically no place where they could

obtain shelter. The freedom of the prisoners during the day was absolute, even to the extent of accepting employment from local mining companies.

In the thick of its fighting in Galicia, Russia had another problem to deal with, which was the Russianization of the country. In the middle of December, 1914, arrangements were made under the auspices of a member of the Duma charged with national education in Galicia, for a large number of elementary school teachers in the native schools of Galicia, to attend at certain centers a series of lectures on Russian language and literature. Lember, Sambor, Tarnopol, Stanislawoff, and Chernovtsi were the first towns chosen for the opening of these courses. Besides this measure, Russia, in the following month, opened ten model elementary schools where all teaching was given in the Russian language. These were in small towns and villages.

CHAPTER LXXII

AUSTRIANS AGAIN ASSUME THE OFFENSIVE

ON December 14, 1914, the Russian General Staff announced that it had "discovered the enemy trying again to assume the offensive in Galicia." Two days later, Austro-German columns were pouring over the Dukla. It was understood that three new German army corps had been sent to the eastern front, making nine new corps since the beginning of hostilities, and that three Austrian corps were withdrawn from Serbia. The number of troops entering Galicia through the mountain passes was estimated at 175,000 men.

This movement compelled the Russians to withdraw the raiding parties which had invaded Hungary. It is unlikely, however, that Russia had planned to invade Hungary in force, so long as Przemyśl and Cracow stood firm. As the situation then was, it would have been a perilous feat to send an army any distance across the mountains. Before such an invasion could be at-

tempted, it was first necessary that the positions of the Russians in Western Galicia and Poland should be greatly strengthened.

When the new Austro-German reinforcements arrived in Galicia over the Dukla, the extreme southern end of the Russian line below Cracow was pushed back from advanced positions west of the Raba to and over the Dumajec. But the Russians did not regard the menace from this quarter as a grave one. Announcement was made by General Sukhominoff, the Russian Minister of War, on December 23, 1914, that it had been stopped "absolutely." We have said before that it was at the Austrians, rather than the Germans, that the Russians wished at this time to strike a telling blow.

On December 28, 1914, General Dankl's army sought to help the main German forces by passing over the Nida near its junction with the upper Vistula above Tarnow. The Russians suddenly were reenforced at this point by troops who swam the ice filled stream, attacked the Austrians on their flank, drove them back, and took 10,000 prisoners.

It was about this time, when Radko Dimitrieff was operating so successfully in the neighborhood of Tarnow, that General Brussilov resumed the offensive in Galicia. He was able to feed and munition his army from Kiev. Practically all the railroad system of Galicia could be utilized by him for maneuvering troops and distributing supplies. His troops numbered only about 250,000, but their strength was increased by railway facilities. General Brussilov could afford to send a large force under General Selivanoff to help invest Przemyśl.

To the Russians, however, Przemyśl was not of immediate importance. The fortress commanded the railroad leading past Tarnow to Cracow, and would have been badly needed, it is true, if the army of Dimitrieff at Tarnow had been attacking Cracow. But the army of General Ivanoff had been forced by this time to retire about fifty miles north of Cracow. Therefore, the smaller force commanded by Dimitrieff was unable to do anything against Cracow from the east. Therefore, it withdrew from the upper course of the Dunajec River and became intrenched along the more westerly tributary of the Dunajec, the Biala.

The Russian line extended from the Biala to the Dukla Pass in the Carpathians. Still further eastward, all along the lower valleys of the Carpathians, the army of General Brussilov was holding out against a large Austro-Hungarian force. This was under the command of General Ermolli.

The chief offensive movement of Ermolli in December, 1914, was directed toward the relief of Przemyśl. As has been indicated, his lines ran through Grybów, Krosno, Sanok, and Lisko, thereby putting a wedge between the army of Brussilov and that of Dimitrieff. He attacked Dimitrieff from the east along the line of the Biala and the Dunajec. In Christmas week Dimitrieff administered a heavy defeat to him, and took nearly thirty thousand prisoners and many guns. In this way he helped prepare for new plans which Grand Duke Nicholas and his staff had prepared for the Russian army in Galicia for the new year.

Cracow had successfully resisted assault, and seemed likely to hold out against the best efforts of the Russians. The gateway to Silesia had been closed. Hindenburg had achieved one of his chief objects in forcing the central Russian forces back. He had paid a huge price in men in order to establish a deadlock of warfare in trenches, about midway in the big bend of the Vistula. Nevertheless, from the German viewpoint, the result achieved was worth it.

If the battle for Silesia had been won in November, 1914, by General Russky and General Ivanoff on the field in front of Cracow, Italy and Rumania might have been brought into the fight by their continued advancing movement. Austria and Hungary thus might have been attacked and overcome by huge forces from three sides. If Austria-Hungary fell, the overthrow of Germany might have been threatened. Hindenburg's strategy had put this out of the range of possibility.

It was such developments as have been mentioned that caused the Russian commander in chief to decide on Hungary as the next object of attack. He planned to bring direct pressure upon Vienna and Budapest and so force first the Hungarians and then the Austrians to ask for terms of peace. If they did not, he

counted on Italy and Rumania entering the war and assuring victory for the Allies.

On Christmas Day, 1914, under such conditions, began the great battles of the Carpathians, which continued for many months to be a crisis of the war. The Russians were outnumbered, but their position was favorable. On December 25 they advanced on the Dukla Pass. Meanwhile fierce fighting continued at various points in Galicia. In the neighborhood of Tuchow, south of Tarnow, the Russians, on observing the advance of the Twenty-sixth Austrian Brigade, slipped past on parallel roads and surprised the Austrian rear. The Russians opened fire with machine guns and virtually annihilated the whole brigade. In two days' fighting in southern Galicia, near the Carpathians, the Russians captured more than 4,000 prisoners, including a major of the General Staff and five other officers, besides three heavy guns and two machine guns. In this region the Russians were moving small detachments through the mountain passes.

Many spectacular engagements took place during the development of the Russian offensive among the mountain spurs of the Carpathians. On Christmas Day, 1914, two Russian infantry regiments, under a murderous fire and wading waist deep in the icy water of the River Jasiolka, dislodged by bayonet charges the Austrians from their line and took as prisoners four officers and 150 men. On the same day an inferior force of Austrians surprised a Russian detachment and took 4,000 prisoners.

In another engagement south of the Vistula, in the region of Tarnow, the Russians drove back the Austrians from the Tuchnow-Olpiny line. The enemy abandoned ten rapid firers and the Russians took prisoner 43 officers and more than 2,500 men. The next day, December 2, 1914, continuing the pursuit of the Austrians, the Russians captured 8 machine guns and about 1,000 prisoners. The Russians occupied the heights near Siedlizka, on the left bank of the Biala River. This gave them possession of a twenty-mile strip of territory separating the two Austrian forces.

Late in December, 1914, all attacks by the Austrians in the

territory between the Pilica and the upper reaches of the Vistula ceased and the Russians assumed the active offensive in this region. They cleared the left or easterly bank of the Nida River by the capture of an obstinately defended Austrian position which was taken by storm.

South of the Vistula, or astride it on the front from Opatow across the Biala River to Biecz, the Russians took prisoners 200 officers and 15,000 men in their sweeping process. A retreat of Austrians in Galicia along the Lisko-Sanok-Dulka-Zmigrod front was precipitate, the nature of the country favoring them, the corridor-like valleys and passes preventing the Russians from pursuing them over parallel roads or harassing their flanks. Only six roads cross the Carpathians, two of which are little more than mountain trails. Owing to the unbroken character of this region, the Russian cavalry was able to do little scouting, while the extreme cold interfered with the work of aeroplanes.

In western Galicia the Russians made progress in spite of the almost impassable condition of the country due to mud, driving the enemy from the front of Stromnik-Gorlice-Jasliska, taking guns and a large number of machine guns.

The year of 1914 closed with the Russian troops advancing in western Galicia, having stormed several fortified works of the enemy, east of Zakliczyn, making prisoners of 44 officers and 1,500 soldiers, and capturing 8 machine guns.

Southwest of Dukla Pass the Russians had dislodged the Austrians from positions they had strongly fortified. They had also realized an important success south of Lisko and had repulsed counterattacks by the enemy in the Carpathians at Uzsok Pass and renewed sorties by the garrison at Przemysl.

Early in January, 1915, the Russians developed great activity in Bukowina and the Carpathians, without making much impression on Austrian positions which they attacked on the Sucwaza River, in the Upper Csermosz territory, and also further west, on the ridges of the Carpathians. In the district of Gorlice and to the northwest of Zaklitzu determined Russian attacks were repulsed. During the fighting at Gorlice the Austrians stormed and captured a height south of there.

During the second week in January, 1915, heavy rains put a stop temporarily to the Russian offensive southward in the direction of Neu Sandek, and at the same time to the Austrian offensive in Russian Poland. A thaw following rain converted the whole country into a vast morass. It was physically impossible for the Austrians to bring up heavy artillery, without which the Russian position along the Nida River could not be forced.

The Russian lines on the east bank of the Nida followed the heights, which were admirably suited for intrenchments and well covered with positions for the Russian artillery fire. There was little firing, however, except an occasional artillery duel when the fog permitted and sporadic local infantry firing. Conditions were similar east of Cracow, the adversaries being well intrenched on opposite sides of the Donajec River.

During this time another determined sortie was made by the garrison at Przemysl, preceded by extensive cavalry reconnaissance. The Austrian infantry then advanced in force in the direction of a wood near the city. The Russians opened fire, but the Austrians rushed forward and gained the cover of the woods. They continued to push forward and the Russians permitted them to advance close to their position before making a serious attempt to halt them.

With the fighting thus at close range, the Russians opened a terrific fire from rifles and machine guns. The battle raged for several hours, with heavy losses on both sides. The Austrians then retired to the fortress.

From the middle to the end of January, 1915, fierce snowstorms and bitter cold interfered with the activity of both Russians and Austrians. There were few engagements. Toward the end of the month, concentration of Austrian troops in Bukowina became stronger. On January 21, 1914, an Austrian force, including an infantry division with artillery, attacked the Russian front in the region of Kirlibaba, but was repulsed.

On the night of January 27, 1914, the Russians were driven back in the Upper Ung Valley from their positions on both sides of Uzsok Pass. This was one of the most important of the Carpathian passes, for the possession of which many important

engagements had been fought since the beginning of the war. It was strongly intrenched and stubbornly defended in several good positions, one behind the other. It fell into the hands of the Austrians after three days of hard fighting. West of the Uzsok Pass, Russian attacks were repulsed with heavy losses. Near Vezeralles and Volovco battles ended with the Russians being driven from the heights of the pass. The Austrians took 400 prisoners.

During the latter part of January, 1915, there were no developments of importance in Galicia.

PART VI—RUSSO-GERMAN CAMPAIGN

CHAPTER LXXIII

FIRST CLASH ON PRUSSIAN FRONTIER

THE first clash of arms between the Russian and German armies occurred on August 6, 1914, near Soldau, East Prussia. In this chapter we will follow the events which were taking place on this frontier, simultaneously with the movements of the German invasions of Belgium and France, the Austro-Serbian campaigns, the Russian invasion of Austria, and the campaigns in the other parts of the world. The general causes preceding the outbreak of the war have been fully narrated in Volume I, while the theatre of the following campaign is clearly described in the chapter on that subject. It is necessary at this time, however, to review the fighting lines before we bring the mighty German army and the Russian hosts into combat on their first battle ground.

We have seen that for many years previous to the outbreak of the great European War all the countries involved had been forced by political, economic, and social conditions to work, each country in its own way, toward the same main object—military preparedness. Many factors, of course, determined not only the means for achieving this result, but also the degree to which it was finally accomplished. At this time we are interested only in the results so far as they affected Russia and Germany at the beginning of the war.

When the armies gathered on the Russo-German frontier, both of these countries had reached a high degree of military efficiency. Germany, which for decades had been the acknowledged leader

among the great powers as far as army development was concerned, had practically concluded the increases and improvements for the accomplishment of which its people had only recently submitted to a special scheme of very extensive taxation, the "Wehrbeitrag." By the results of this move, we find that the western defenses against France and indirectly against England profited much more than those in the east against Russia.

Russia, as its army stood ready to strike its first blow at Germany, had drawn to the fullest extent the obvious conclusions impressed upon it by its defeat in the Russo-Japanese War. Graft, which had played such great havoc during its last war, had been stamped out. The artillery equipment had been brought up to date and the troops in charge of it had increased vastly their skill in its use. Everywhere formations had been rearranged, increased and improved, and this rearrangement had affected especially the distribution of the empire's forces. Never before in its history had Russia concentrated so many troops in its eastern and central provinces.

In setting its armies into action, Germany faced by far the easier problem. Its territory was much more compact, its means of communication were vastly greater and superior, and racial differences between its various parts were practically nonexistent. With a total area of 208,825 square miles, the German Empire possessed 39,532 miles of railroad, whereas the Russian Empire in Europe with 2,100,000 square miles had only 35,447 miles of railroad. The Germans had the further advantage of having brought all their means of transportation to the very acme of perfection, while the Russians were lacking in equipment as well as in organization.

The remarkable quickness and effectiveness with which the Russian army operated at the moment of war indicates not only an unexpectedly high state of preparedness, but also a remarkably high degree of leadership on the part of its generals.

The general staffs of both Russia and Germany were as well prepared to meet on the battle ground as far as it had been within human power and foresight. Each side had collected all available information concerning the other. The German genius for

organization had proved itself especially valuable and fertile in this direction. On the basis of this knowledge, well-defined plans of campaign had been worked out, and the leaders of both sides had many opportunities to exercise their strategic abilities, not only by solving problems created by these plans theoretically across the tables in their respective war colleges, but also practically during the annual periods of maneuvers.

As the armies faced each other in the first week of August, 1914, the strategy of both sides was determined chiefly by three factors: (1) by the obstacles and defenses which nature itself had placed in the localities in which the fighting was likely to take place; (2) by the means of defense and offense which were available; (3) by political conditions.

At the beginning of the war all but the last were absolutely known quantities, and as far as Russia and Germany were concerned this last factor could be figured out comparatively easily. For it was clear that if Germany would become involved in a war with Russia, Austria would be found fighting by its ally's side and *vice versa*. It was also fairly reasonable to assume, and had immediately become a fact, that under such conditions Germany would find itself involved with France too, which would mean that Germany's available fighting strength would have to be divided into two parts at least. It was, of course, a matter of fairly common knowledge that Germany's concentration was much more powerful on its western border than on its eastern, so that Russia could count with reasonable certainty on a comparative weak, even if well organized, resistance on the part of Germany at the beginning of war.

Germany's strategy in the east was influenced chiefly by its plan for the western campaign, which we have already considered in the preceding chapters. The fight against France seemed to be of greater importance and urgency to Germany than that against Russia. Why German strategy reached this conclusion does not concern us here. In passing, however, it may be well to remember that the German provinces adjoining France directly, or indirectly behind Belgium and Luxemburg, were of much greater importance and value to the Germans than their

provinces adjoining Russia, and that even the temporary loss of these would probably have spelled disaster to Germany. Then, too, it was on the western side that England's influence was being felt; and, furthermore, the French army, though much less numerous than the Russian, was a more formidable adversary on account of its greater effectiveness, as well as of the certainty of its much quicker movements.

Russia had a preponderantly large advantage in numbers over Germany. The result of this fact, from a strategic point of view, was that Russia could dare much more than her adversaries. She could strike stronger, quicker, and with greater frequency in more directions, and could risk to extend her operations much farther. The fact that means of transportation, as has been pointed out, were much better developed in the German frontier provinces than in those of Russia, was a disadvantage only as long as Russia fought on its own territory, though even then, necessarily, the invading enemy would be hampered at least equally by the lack of transportation facilities.

Russia's natural advantage of greater numbers pointed clearly to an immediate offensive which would bring with it the promise of more advantages, while both German and Austrian conditions indicated with equal clearness as the safest and sanest strategy a policy of "watchful waiting," at least until such time when large enough forces could be spared from the western front or concentrated from available reserve sources to promise to a more aggressive policy a fair chance of success.

Thus Russia decided to strike immediately against Germany as well as against Austria. With the latter campaign we are not concerned here. How she devoted herself to this twofold task with all the power and means at her command we shall see in the following narrative.

The hosts of Russia were standing on the German frontier. In the four provinces adjoining Austria-Hungary a total of sixteen army corps, or one-half of all the Russian army in European Russia, were available. By July 31, 1914, the czar had ordered the general mobilization of army and navy. The German Ambassador in Petrograd was instructed to notify the Russian Gov-

ernment that unless this order was countermanded within twelve hours, Germany would immediately respond by mobilization of her army and navy. As the Russian mobilization had continued, Germany officially took the same step in the late afternoon of August 1, 1914, after a state of war had already been proclaimed for the entire empire on July 31, 1914.

The fighting forces on the German side at the beginning of the war on or near the east front included the First Army Corps at Königsberg, the Twentieth at Allenstein, the Seventeenth at Danzig, the Fifth at Posen, and the Sixth at Breslau. These mustered a total of forty-four infantry, twenty-one cavalry, and twenty-five artillery regiments, augmented by four battalions of rifles (Jaeger), and twelve formations of technical troops. The entire peace effectiveness of these formations was about 150,000 men, which at full war strength undoubtedly meant at least not less than 500,000 men, of whom about one-half were of the first line, the balance being made up of reserves and Landwehr troops.

The Russians drew up, in the face of the Germans, two armies: the Army of Poland and the Army of the Niemen. The latter in peace time centered in Vilna and consisted of five army corps; the former used Warsaw as its base and consisted of at least as many army corps. It now held a wide front from the Narev in the north to the valley of the Bug River. These two armies together had an effectiveness of almost twice as many men as the German forces, supported as they were by a series of well-garrisoned fortresses: Grodno, Osowic, and Bialistock in the north; Lomza, Novo Georgievsk, and Warsaw in the center; and Ivangorod and Brest Litovsk in the south. In its entirety the mobilization of these forces was completed about the third week of August, 1914, but by the end of the first week the Army of the Niemen had completed its mobilization, and it was from there that the first blow was struck.

This army was commanded by General Rennenkampf, one of the few Russian generals who had succeeded in coming through the Russo-Japanese War, not only with an untarnished, but even with an enhanced reputation. Its task was to invade the northern part of East Prussia, striking directly at Königsberg.

Small engagements, of course, took place all along the Russo-German border between the advance guards of the two armies from the day war had been declared.

On August 6, 1914, a Russian cavalry division crossed over into the enemy's country south of Eydtkuhuen. The next ten days saw many isolated advances of this nature, all of them initiated by the Russians, and most of them accomplishing their respective objects. One small force ventured as far north as the immediate proximity of Tilsit of Napoleonic memory.

CHAPTER LXXIV

ADVANCE OF RUSSIANS AGAINST THE GERMANS

ON August 16, 1914, within seventeen days after the official beginning of the Russian mobilization, everything was in readiness for the general advance. The next day immediately developed the first strong German resistance. At Stallupoehnen the German First Corps from Königsberg, under General von François, supported by two reserve corps, attempted to stem the Russian flood. Though they succeeded in taking 3,000 prisoners and some machine guns, they had to fall back upon Gumbinnen. The pressure of the superior Russian numbers—four active and two reserve corps—proved too strong. The battle front now was about thirty-five miles long, extending from Pillkallen on the north to Goldap on the south, with Gumbinnen in the center.

On August 20, 1914, the first real battle on the eastern front was fought before this pretty country town, which was founded in the beginning of the eighteenth century, and had gradually acquired about 15,000 people. General Rennenkampf used his numerical superiority for a powerful onslaught against the enemy's center. Fourteen hours of the most stubborn fighting—beginning at dawn and ending only with the coming of night—resulted in the final withdrawal of the German center. Though

artillery did some preparatory work, it was the slashing thrust of glittering bayonets in massed formations and the tearing devastation of hand grenades that carried the day. The German wings kept up their resistance for the next day, but finally joined the main army which had withdrawn through Gumbinnen to Insterburg. The losses on both sides probably were about even, amounting to at least 5,000.

The certainty of the Russian numerical superiority undoubtedly was responsible for Von François's continuation of his retreat to his main base, Königsberg. The Russians lost no time in following and reached Insterburg on August 23, 1914. Practically without further opposition all of northern East Prussia as far as the river Memel was in General Rennenkampf's hands, Tilsit, Labiau, Tabiau, Gerdauen, Korschan, Rastenburg, Angerburg, and Goldap indicate the limits of his conquest. With it went four of the six railroads centering in Königsberg, leaving open only the two lines running to Allenstein and Danzig, which, of course, meant serious danger to this important German fortress.

The Russian army of the Narew had, in the meantime, pushed its advance with equal rapidity and success from the south. Its commander, General Samsonoff, had won laurels in Manchuria, and had acquired considerable military reputation as a commander in Turkestan and as a member of the general staff. He had approximately as many men at his disposal as his colleague—about 250,000. His task, however, was more difficult. For his entire front would face, almost immediately after crossing the border, the treacherous lake district in the south of East Prussia. For his advance he used the two railroads from Warsaw into East Prussia, on the west through Mława and Soldau, and on the east through Osowiec and Lyck. From the latter town he pushed his right wing forward in a north-westerly direction, and sent his center toward the southwest to Johannisburg.

On August 23 and 24, 1914, to meet this advance, the Germans had available only one active army corps, centered in Allenstein, the Twentieth. Local Landwehr formations found the task

of delaying the Russians far beyond their power. In quick succession Samsonoff took Soldau, Neidenburg, Ortelsburg, and finally Allenstein. At Frankenau, just west of the Mazurian Lakes, his right wing connected with the Twentieth German Corps, which, supported by strongly prepared intrenchments, managed to hold up the Russian advance, but finally had to give way and fall back on Allenstein and Osterode. This gave to the Russians command of one more railroad to Königsberg, that from Allenstein. Though the two Russian armies had not yet formed a solid connection, they were in touch with each other through their cavalry, and the Russian front was in the form of a doubly broken line running from Friedland through Gerdauen to Angerburg (Niemen Army) and from there through Frankenau and Allenstein to Soldau (Narew Army). The former, facing southwest, in connection with the latter, now threatened not only Königsberg, but the defensive line of the Vistula from Thorn to Danzig. The greater part of East Prussia seemed securely in the possession of more than 500,000 Russian soldiers, chiefly of the first line, and under apparently very able leadership.

The occupied territory suffered severely. Bombardment and fire had laid waste, at least partially, some of the towns and a great many of the villages. Requisitions for the support of the invading army necessarily brought great hardships and losses to the unfortunate inhabitants. The avalanche-like success of the Russian arms, the clearly displayed weakness of German numbers and the rapid retreat of their forces naturally added to the terror of the peasants who make up the largest part of East Prussia's population. By thousands they fled from their villages and hamlets, carrying on their slow oxcarts or on their shoulders whatever they had gathered as their most precious possessions in their first hours of fear and terror. To them the word "Cossack" still called up pictures of the wild hordes that had overrun their country during the Seven Years' War, and later again in the Napoleonic wars. The large, strongly fortified cities of Königsberg and Danzig seemed to hold out the only hope for life and security, and toward these they flocked in ever-increasing masses. Even Berlin itself had brought home to it some of the

more refined cruelties of war by the arrival of East Prussian refugees.

We have already seen that at the outbreak of the war only five active German corps were left on the eastern front. Two, the First and the Twentieth, had, so far, had to bear the brunt of the Russian advance; one other, the Sixth, had been sent from Breslau to detract, as much as possible, the Russian onslaught against the Austrian forces in Galicia; and the other two, the Fifth and Seventeenth, stationed in Danzig and Posen, were too far back to be immediately available.

CHAPTER LXXV

BATTLE OF TANNENBERG AND RUSSIAN RETREAT

WHEN on August 22, 1914, the full strength of the Russian attack became evident, the German General Staff decided on heroic measures. An immediate increase of the German forces to the point where they would match the Russian seemed out of the question, and the solution of the problem, therefore, clearly lay in the ability of the general staff to find a general who could, with the forces on hand, meet the requirements of the situation—free East Prussia of the invader.

Fortunately for Germany, its hour of need on the eastern front brought forth this man. There had been living for a number of years in the west German city of Hanover a general who had been retired in 1911 as commander of an army corps. His name was Paul von Hindenburg. He was at that time in his sixty-seventh year, but having been an army officer since his youth, he was "hard as nails," and from a military point of view still in the prime of his years as a leader.

It was well known in military circles that Von Hindenburg had acquired the most thorough knowledge of the difficult lake district south of Königsberg. He had devoted his time and

energies for years to a most exhaustive study and investigation of the Mazurian Lakes and swamps. Again and again he had tramped through them on foot, picked his way along their treacherous paths on horseback, and finally put their few roads to the supreme test of the motor car. He knew their every shortcoming and advantage. His topographical information included fording places for men and guns, and quicksands.

Much of this knowledge he passed on to younger officers to whom he lectured at the General Staff College in Berlin, and when, only some years ago, practically all arrangements had been concluded by powerful financial interests to drain and cultivate his beloved lakes and swamps for agricultural purposes, he succeeded in overthrowing these plans at the last moment. It is said that so powerful were these interests that Von Hindenburg succeeded only by going, at last, to the emperor himself, and convincing him that the natural defensive possibilities outweighed in value any amount of increased acreage of reclaimed land.

We have already shown the problem which faced Von Hindenburg. To drive the Russians out of East Prussia he had to defeat two armies composed of at least 500,000 men, whose offensive momentum had been raised to a very high power by a highly successful advance of more than a week's duration. He, himself, could count only on far inferior numbers, not more than the equivalent of four army corps. These he had to assemble without loss of time and with as much artillery equipment as could be spared from all directions. From Königsberg came the biggest part of the beaten First Corps and its reserves. What was left of the Twentieth Corps, of course, was right on the ground. Undoubtedly the fortresses of Danzig, Graudenz, Thorn, and Posen had to yield parts of their garrisons. However, most of these were troops of the second line.

On August 23, 1914, Von Hindenburg arrived at Marienburg, about seventy miles southwest from Königsberg and almost as far to the northwest from Allenstein, and assumed command of the East Prussian forces. Only three days later, on August 26, 1914, he was ready to put in execution the plans on which he had worked for almost a lifetime.

Hindenburg's general strategical plan was as simple as the carrying out of it, considering the means at his command, was difficult. Facing him were two armies still out of contact with each other, or at least only very loosely connected. Each alone outnumbered him at least by 50,000; combined they were more than three times as powerful as all his forces. His only hope, therefore, was in attacking them separately. Thus he chose to strike first at Samsonoff's army which was much further spread out than Rennenkampf's, and would find it much more difficult than the latter to keep open its main line of retreat and supply. Its left rested on Soldau, its right on Frankenau, while its center had been pushed forward to Allenstein through Soldau, and south-east from it ran the only direct railroad to his Polish base by way of Mława. Three other lines centered there, one in the west from Thorn, one in the northwest from Eylau (connecting with Danzig and Königsberg), and one in the east from Neidenburg, which from there run north to Allenstein and northeast to Johannisburg and Lyck. Apparently centering his efforts on pushing his advance, Samsonoff had neglected to secure the former two roads.

On August 26, 1914, Von Hindenburg occupied both and took Soldau Junction. The shortest line of retreat had now been cut off to the Russians, whose forces were scattered over a considerable territory, and on account of lack of railroads could not be concentrated quickly or efficiently at any one point. Though a determined effort was made on August 27, 1914, to retake Soldau, it was foredoomed to failure. Samsonoff's left was thrown back on Neidenburg, making his front even more unwieldy than before.

At this time the German front was very short, its left being at Hohenstein, about halfway between Soldau and Allenstein and slightly northeast of Tannenberg. But it made up in activity what it lacked in length. In vain the Russians tried to break the German ranks and open up a road to the northwest. Much blood was spilled on both sides during three days' fighting, but the German line held. In the meantime the Russians had evacuated Allenstein, feeling the imperative need of shortening their front. This gave Von Hindenburg the railroad that ran almost parallel to the Russian front as well as the splendid main

road that runs alongside of it. Commandeering every available motor vehicle from the entire surrounding countryside, he immediately extended his line and swung around the Russian right as previously he had swung around their left. Almost every road, rail or otherwise, that was of any importance was now in the hands of the Germans and along them could be sent men and guns with overwhelming rapidity. With relentless energy Von Hindenburg now used his intimate knowledge of the territory in which he was fighting. Wherever he knew the most hopeless territory to be, there he drove the Russians. Mazurian swamps and lakes did all that he had ever claimed they would do and more. They swallowed up his enemy by the thousand, they engulfed his guns and sucked in his horses.

Within a week after Von Hindenburg had reached East Prussia the problem of the Narew Army had changed, from how to extend its advance most quickly, to how to escape from this bottomless pit, along the few inadequate lines of escape that were left. The morale of this Russian army was broken. For even the most stolid Russian peasant soldier, whom neither the roar of guns nor the flash of bayonets could move, quaked at seeing whole companies and batteries disappear, in less time than it takes to tell about it, in the morasses of a country without firm roads and a minimum of solid ground.

On the last day of August, 1914, thousands of Russians had laid down their arms and were sent back into Central Germany. Of Russian armies of more than a quarter of a million nearly a hundred thousand fell into German hands. Almost half as many more were killed or wounded. The Russian commander in chief was killed on August 31, 1914. Only one corps escaped by way of Ortelsburg and Johannsburg, while scattered fragments of varying size fought their way out, some into North Poland and some into the protecting arms of the Niemen Army. Most of the guns of Samsonoff's army were either captured by the Germans or lost in the swamps. This one week's battle among the Mazurian Lakes is known now as the Battle of Tannenberg, so named after a small town west of and halfway between Soldau and Allenstein.

Without giving his troops any rest Von Hindenburg now turned against Rennenkampf's forces. But, in spite of the rapidity of movement, the German commander could not accomplish all that he had set out to do. Apparently his plan was now to strike north past Angerburg and Goldap to Gumbinnen, or possibly even to Eydtkuhnen in order to cut off the retreat of the army of the Niemen and drive them in a southerly direction to their destruction in the Mazurian Lakes, just as he had done in his easterly drive against the Narew Army. But Rennenkampf was too quick. He recognized the danger that threatened him through the defeat of Samsonoff's forces and he began his retreat as soon as it became evident that the other army's cause was lost. He was in a much more advantageous position than his colleague had been. For not only did the territory through which he had to fall back offer no particular difficulties when once he had escaped Hindenburg's attempt to push him up against the Mazurian Lakes, but he had also a fairly efficient network of railroads at his command centering in Insterburg.

Long before he evacuated this city on September 11, 1914, he had drawn in most of his outlying formations in the north and west and had sent them back safely across the border and behind the protection of the Niemen and its shield of fortresses—Kovno, Olita, and Grodno. In this he was also materially assisted by the stubborn resistance which Von Hindenburg encountered at Lyck at the hands of a small army that had been sent out from Grodno to aid him, and the nucleus of which consisted of an entirely new Finnish, and an equally complete, Siberian Corps. In spite of this, however, the pressure of the victorious Germans was strong and rapid enough to force him to a generally hurried retreat. The losses in killed and wounded were comparatively small, for almost all the fighting was rear-guard action. But the Germans succeeded in gathering in about 30,000 more prisoners, chiefly detachments that had been unsuccessful in connecting in time with the main army. Much more serious was the loss of some 150 guns and vast quantities of war material for the removal of which both time and means had been lacking.

On September 15, 1914, Von Hindenburg could announce that the last of the invaders had either been captured or driven back and that not an acre of German soil was in the possession of the Russian forces. On that date, moreover, he had already advanced far enough into Russian territory to occupy the seat of government of the Russian province of Suwalki, almost 150 miles in direct line east of Tannenberg, though less than 20 from the German border. From that point on he entrusted the further conduct of these operations to Lieutenant General von Morgen, who had been one of his Division commanders at Tannenberg.

By September 23, 1914, Rennenkampf had completed his retreat behind the Niemen. The fighting which took place during the ensuing week is commonly designated as the "Battle of Augustovo," though it covered a much larger area. Augustovo itself is a small town about ten miles from the German frontier, about twenty miles south of Suwalki, and forty miles northwest from Grodno.

The German advance clearly suggested an attempt on their part to force a crossing of the Niemen. This in itself was a very difficult undertaking. The river is more than 600 feet wide, too deep to ford, and naturally none of the few bridges over it were available for the Germans. Furthermore its right bank, which was held by the Russians, is very high, commanding absolutely and practically everywhere the low left bank which in many places is almost as swampy as the worst parts of the Mazurian Lakes. West of the Niemen and between it and the frontier the country is full of lakes, much as in the Mazurian region. The Germans, of course, were under the same disadvantages there as the Russians had suffered from in East Prussia. Of railroads there were none except one, running in the shape of a semicircle from Grodno through Augustovo and Suwalki to Olita.

On September 25, 1914, in spite of these conditions and disregarding the weakened state of their forces, the Germans attempted to cross the Niemen simultaneously at two places. About thirty miles north of Grodno they had constructed a

pontoon bridge and began to send across their infantry. It was only then that the Russians opened up their murderous fire from well-protected positions. Against it the Germans were practically helpless. In spite of large numbers of guns that they brought up, and in spite of repeated efforts of crossing in massed formations, the result was the same: immense losses on the part of the Germans and comparatively slight ones on the part of the Russians. Indeed, the last attempt was not only frustrated, but the Russians even forced back the Germans some miles.

Somewhat farther south the other attempt met with a similar fate. There not only had the Russians posted their heavy guns on the right bank, but infantry had been strongly intrenched on the left. Their combined opposition forced back the Germans under heavy losses after they had fought all day and all night. During the last week of September, 1914, the Germans were gradually forced back along their entire front. Much of the fighting was done in the dense forests east of Augustovo and was hand-to-hand fighting. In the afternoon of October 1, 1914, the Russians recaptured Augustovo after the Germans had made a determined stand, yielding only when heavy guns bombarded their positions from the west and northwest. On the next day the Germans had to retreat from Suwalki and withdraw the lines that they had extended northward, and fall back behind their frontier. This meant the end of the German attempt to cross the Niemen and the beginning of the second invasion of East Prussia.

CHAPTER LXXVI

SECOND RUSSIAN INVASION OF
EAST PRUSSIA

WONDERFUL as had been Von Hindenburg's accomplishment in defeating the Russians and practically destroying one of their first-line armies, the latter's recuperative power was almost as surprising. Deprived of the prize of three weeks' fighting, defeated, and driven by the enemy on their entire front for a depth of fifty miles into their own country, they were nevertheless ready in a few days for a new offensive. Undoubtedly this was partly due to the talent of their new commander, General Russky, who had been sent up from Galicia, where he had gathered experience as well as honors. But more so was it due to the protecting defenses of the Niemen and the opportunities they offered for reorganization, rest, and the collection of new forces.

The situation which was faced on the first week of October, 1914, was perilous to all the armies engaged. Russia's fortresses on its eastern front were concerned for a twofold purpose. In the first place, they were to lend increased power of resistance to whatever means of defense nature had provided, and this function, of course, determined their location. Wherever rivers or other natural obstacles would offer themselves to an invading enemy, there Russia had added especially strong artificial defenses.

Any army invading Russia from East Prussia in a southerly direction would have to cross the Narew River and its principal tributary on the right, the Bober. These two run, roughly speaking, parallel to the Russo-German border at a distance of about thirty to thirty-five miles, and no army attempting an invasion east of the Vistula and south of the Niemen could advance further than this short distance without first crossing the Narew and Bober.

The group of fortresses along this natural line of defense

begins opposite the southwestern corner of East Prussia with Osowiec, situated on the railroad that runs from Lyck to Bjelostock. Thence it stretches in a southwesterly direction through Lomsha, Ostrolenka, Rozan, Pultusk to Novo Georgievsk, which latter is the most important of these, commanding as it does the conflux of the Narew, Wkra and Vistula rivers.

This series of fortified places forms the center of the system of fortifications against Germany. In a southeasterly direction from it the Vistula offers another strong natural line of defense strengthened still more by the two big fortresses of Warsaw and Ivangorod, behind which, on a bend of the Bug River and almost equally distant from both, Brest Litovsk, at the very western end of the vast Pripet Swamps, defends the entrance to central Russia, to Smolensk and Moscow.

Adjoining Osowiec on the north and making even more formidable the naturally very strong defensive line of the River Niemen are Grodno, Olita, and Kovno.

The second purpose of all these fortified places is to protect the rear of an offensive army advancing toward Germany and to offer a haven of refuge if it should become necessary for such an army to fall back. At the same time, they serve as powerful bases and screens behind which an army of defense could quickly be changed into one of offense. Not only had they served well this last purpose at the time of mobilization, but again and again later on weakened Russian armies succeeded in retreating behind these protecting shields, from which they emerged again a little later, bent on new attacks, after they had been strengthened by reinforcements from Russia's inexhaustible resources of men.

It was thus that the Russian armies saved themselves after Von Hindenburg's smashing victory at Tannenberg. Out of about 650,000 men, forming the Army of the Narew and the Vilna Army, more than 300,000 had succeeded in reaching the shelter of their fortresses.

At that time the German forces, sadly in need of rest, were much too small and too weak to attempt an energetic general attack against either the Niemen or the Narew-Bug lines of

defenses. However, in order to prevent another invasion of East Prussia something had to be done. They therefore advanced a goodly distance into the province of Suwalki, occupying even the seat of its government, a town of the same name. Farther south Osowiec represented a continuous danger to East Prussia, being very close to the border and on the direct railroad to Lyck. Though the Germans were in no condition to undertake a siege, they determined to attempt at least to close the crossing of the Bober at this most advantageous point.

September 18, 1914, saw the beginning of this movement and ten days later heavy artillery in limited force was thundering against the gates of the small but strong fortress.

The suffering on both sides during this period was very great. Keeping continuously moving, fighting day and night under conditions the natural difficulties of which had been increased still more by unending rainstorms, resulting in long delays for food and other supplies, Russians as well as Germans displayed wonderful energy and perseverance. And in spite of these difficulties, in spite of roads ankle deep in mud, the Germans advanced and the Russians re-formed their forces.

On October 2, 1914, the Russian advance started from Grodno as a base. The Third Siberian and parts of the Twenty-second Finnish Army Corps, forming the left wing, met the enemy at Augustovo. For two days the battle lasted, and though it involved only comparatively small numbers it was one of the most sanguinary engagements of this period. Both sides lost thousands of men and large quantities of war equipment. The Germans having received reenforcements, attempted a flanking movement against the right wing, undoubtedly with the intention of attacking the Russians from the rear. They succeeded in getting a small force around the Russian right, which, however, had to be withdrawn very soon. For the balance of October the fighting raged along the entire front from the Niemen in the north to Lomsha in the south, a distance of about 150 miles. Neither side was able to gain any decisive advantage, for both the offensive and the defensive was fought with equal stubbornness. One day fortune would smile on Russia's masses, only

to turn its back against them during the next twenty-four hours. The lack of success of the German flanking movement around the Russian right brought to the latter greater freedom of movement. It advanced toward Wirballen with the object of gaining the road to Eydtkuhnen and Stallupoehnen, which would enable them to strike once more for the important junction at Insterburg. This attempt resulted in another minor but very sanguinary engagement north of Vysztyn Lake. Again no decision had been reached, though the Russians were getting closer and closer to East Prussia. A Russian attempt to outflank the German left at Schirwindt, a few miles north Eydtkuhnen and right across the line in East Prussia, was not any more successful than the previous German attempt, and weakened the Russian right, just as a similar failure on the other side had weakened the German left. Again honors, hardships, and losses were fairly even.

In the center the Russian advance covered an extensive plain, known as the Romintener Heide. There, too, continuous fighting, a great deal of which was carried on at night, involved usually only comparatively small formations and the result was equally indecisive.

The Russian left wing had been more successful. It had fought its way across the border and taken Wargröbowa. The Germans, however, succeeded in retaking this place as early as October 9, 1914, pursuing the Russians and finally stormed their strong intrenchments a week later. The country here is slightly elevated and the Russians had dug themselves in rather elaborately. Manyfold rows of trenches, in some places six and eight deep, had been thrown up around the small village of Vielitzken which suffered severely during the German onrush.

In the meantime another attempt to take Lyck had succeeded. The direct road through Osowiec was not available on account of the German force located there. So the Russians sent a division forward from Lomsha which, taking Bialla, reached Lyck on October 8, 1914. The Germans, lacking sufficient forces for a successful defense, withdrew not only from Lyck, but also from before Osowiec.

But by October 13, 1914, the Nieman Army's advance into East Prussia had been either forced back or delayed to such an extent that this comparatively weak Russian advance in the extreme south was out of touch with the main forces of the Nieman Army, and therefore in turn was withdrawn.

This practically finished the second Russian invasion of East Prussia. The German forces gradually cleared all of their country of the enemy and followed him even into his own territory. But although continuous fighting went on during the last week of October, again chiefly around Augustovo and Bakalartshev, the Russians for the time being contented themselves with a defensive policy, just as the Germans were satisfied with their success in preventing the Russian advance without going over to a clean offensive.

CHAPTER LXXVII

FIRST GERMAN DRIVE AGAINST WARSAW

WE have already spoken of the strategic position of Russian Poland, of its vulnerability, exposed as it is to attack from the Central Powers on three sides, and finally what Russia had done to strengthen Poland's natural line of defense, the Vistula River, by building fortresses on its most important points. It may be well to recall here that the lower part of this river flows through West Prussia, from Thorn to the Gulf of Danzig. For almost a hundred miles, from Thorn to Novo Georgievsk, it cannot actually be considered of defensive value to Russia; flowing slightly northwest from the latter fortress to the border it is open to German use on either side. But at that point, about twenty miles northwest of Warsaw, any army coming along its valley would have to take first this important fortress before it could continue farther into central Poland. Should it fail in this, it would have to withdraw its forces from the right bank and then force a crossing at some point between Novo Georgievsk and the point where the Vistula enters Russian Poland from Austrian Poland, a few

miles east of Cracow. It is at this point also that the Vistula is swelled by its most important contributory, the Bug River, which, roughly speaking, flows parallel to the Vistula at a distance of about seventy miles from the Galician border to a point on the Vilna-Warsaw railroad, about fifty miles east of Warsaw, where it bends toward the west to join the Vistula. The Bug River thus forms a strong secondary natural line of defense. In the north the Narew—a tributary of the Bug—forms an equally strong defense against an army advancing from East Prussia.

There cannot be much doubt that the plan of the Central Powers originally was to take Poland without having to overcome these very formidable obstacles. If Von Hindenburg had succeeded after the battle of Tannenberg in crossing the Niemen, and if, at about the same time the Austro-Hungarians had also succeeded in defeating their Russian adversaries in Galicia, described in another chapter, this object could have been accomplished very easily by a concerted advance of both along the east bank of the Bug, with Brest-Litovsk as the most likely point of junction. The result would have been twofold: in the first place all of Poland would have been in the hands of the Central Powers; for Russia either would have had to withdraw its forces from there before their three main lines of retreat—the railroads from Warsaw to Petrograd, Moscow, Kiev—had been cut by the invaders, or else the latter would have been in a position to destroy them leisurely, having surrounded them completely. In the second place it would have meant the shortening of the eastern front by hundreds of miles, making it practically a straight line from the Baltic Sea to some point on the Russo-Galician frontier.

In the preceding chapters, however, we have seen that up to the beginning of October, 1914, neither the Germans nor the Austrians had accomplished this object. The former had to satisfy themselves with having cleared their own soil in East Prussia of the Russian invaders and with keeping it free from further invasions, while the latter were being pressed harder and harder every day and had to figure with a possible invasion of

Hungary. It was then that the Central Powers decided to invade Poland from the west, and thus gradually drove out the Russians. Why they persisted in their efforts to gain possession of Russian Poland is clear enough. For in addition to the above-mentioned advantage of shortening and straightening their front, they would also deprive Russia of one of its most important and populous centers of industry, in which the czar's domain was not overrich, and it would remove forever this dangerous indentation in the back of the German Empire.

Before we consider in detail the first German drive for Warsaw, it is also necessary to consider briefly political conditions in Russian Poland.

Ever since the partition of the old Kingdom of Poland among Germany, Austria, and Russia, the Polish provinces created thereby for these three empires had been a continuous source of trouble and worry to each. The Poles are well known for their intense patriotism, which perhaps is only a particular manifestation of one of their general racial characteristics—temperament. At any rate, the true Pole has never forgotten the splendid past of his race, nor has he ever given up hope for a reestablishment of its unity and independence. It is a rather difficult question to answer whether Russia, Germany, or Austria have sinned most against their Polish subjects. The fact remains, however, that all three most ruthlessly suppressed all Polish attempts to realize their national ideals. It is equally true that Russia went further along that line than either Germany or Austria, and on the other hand did less for its Polish subjects than the other two countries. Both in Germany and Austria there existed therefore a more or less well-defined idea that the Russian Poles would welcome German and Austrian troops with open arms as their saviors from the Russian yoke. In Russia a certain amount of anxiety existed about what the Poles would do. The latter, in a way, at the beginning of the war found themselves facing a most difficult alternative. That their country would at some time or other become a battling ground of the contending armies was quite evident. Whether Russia or the Central Powers would emerge as the final victor was at least open to dispute. Whatever side the Poles

chose, might be the wrong side and bring to them the most horrible consequences. It was undoubtedly with this danger in view that the "Gazeta Warszawska" printed on August 15, 1914, an editorial which in part read as follows:

"Remain passive, watchful, insensible to temptation.

"During the coming struggle the Kingdom of Poland will be the marching ground of various armies; we shall see temporary victors assuming lordship for a while; but change of authority will follow, and inevitable retaliation; this several times, perhaps, in the course of the campaign. Therefore every improvident step will meet with terrible revenge. By holding firm through the present conflict you best can serve the Polish cause. In the name of the love you bear your country, of your solicitude for the nation's future, we entreat you, fellow countrymen, to remain deaf to evil inspirations, unshakable in your determination not to expose our land to yet greater calamities, and Poland's whole future to incalculable perils."

This, of course, was far from being a rousing appeal to support Russia's cause, but it was even further from being a suggestion to support that of the Central Powers and revolt against Russia. Polish newspapers of the next day printed a proclamation signed by the Commander in Chief Grand Duke Nicholas prophesying the fulfillment of the Polish dream of unity, at least, even if under the Russian scepter, and promising a rebirth of Poland "free in faith, in language, in self-government."

On August 17, 1914, four of the Polish political parties published a manifesto in which they welcomed this proclamation and expressed their belief in the ultimate fulfillment of the promises made. The net result of the sudden three-cornered bid for Polish friendship and support, then, seems to have been that the leaders of Polish nationalism had decided to abstain from embarrassing Russia, even though their resistance against Germany and Austria with both of which other Poles were fighting was not always very deep-seated.

During the first month of the war practically nothing of importance happened in the Polish territory. German detachments

occupied some of the towns right across the border, in many instances for a short time only. Mlawa, Kalish, and Czeszochowa were the most important places involved.

On August 31, 1914, however, the occupation of Radom, about 130 miles from the German frontier, was reported, and a few days later that of Lodz, next to Warsaw the biggest city of Russian Poland and an important manufacturing center. At about the same time all of the places along two of the railroads running from Germany to Warsaw, Thorn to Warsaw, and Kalish to Warsaw, as far as Lowitz, where they meet, were occupied. In this territory the Germans immediately proceeded to repair the railroad bridges destroyed by the retreating Russians, who, apparently, had decided to fall back to their defenses on the Vistula. The Germans must have felt themselves fairly secure in their possession of this territory, for on September 15, 1914, Count Meerveldt, then governor of the Prussian Province of Munster, was appointed its Civil Governor. A day later the commanding general (Von Morgen) published a proclamation, addressed to the inhabitants of the two provinces of Lomza and Warsaw. In it he announced the defeat of the Russian Narew Army and Rennenkampf's retreat and stated that larger forces were following his own army corps, which latter considered them as its friends and had been ordered to treat them accordingly. He called upon them to rise against their Russian oppressors and to assist him in driving them out of beautiful Poland which afterward was to receive at the hands of the German Emperor political and religious liberty.

About ten days later the "additional stronger forces," which General von Morgen had prophesied, put in an appearance. They consisted of four separate armies, one advancing along the Thorn-Warsaw railroad, another along the Kalish-Warsaw line, a third along the Breslau-Czeszochowa-Kielce-Radom-Ivangorod railroad, and the fourth from Cracow in the same direction. Just how large these four armies were is not absolutely known. Estimates range all the way from 500,000 to 1,500,000 which makes it most likely that the real strength was about 1,000,000. Of these all but the Fourth Army were made up of German sol-

diers, whereas the Cracow Army consisted of Austrians, forming the left wing of their main forces which about that time had been rearranged in western Galicia.

By the time all of these armies were ready to advance, the victor of Tannenberg, Von Hindenburg—who meanwhile had been raised to the rank of field marshal—had been put in supreme command of the combined German and Austro-Hungarian armies in Poland. Though he was fighting now on territory concerning which he had at least no superior knowledge than his adversaries, his energy made itself felt immediately. He pushed the advance of his four armies at an overpowering rate of speed and forced the Russians, who apparently were not any too sure, either about the strength of the opposing forces or their ultimate plans, to fall back everywhere. By October 5 the Russians, attempting to make a desperate stand near Radom, had been forced back almost as far as Ivangorod, and within the week following the Austro-German army, still further south, had reached the Vistula between the Galician border and Ivangorod. The advance of the Germans as well as the retreat of the Russians took place under terrific difficulties, caused by torrential rains which poured down incessantly. Some interesting details may be learned from a letter written about that time by a German officer in charge of a heavy munition train: "From Czeszochowa we advanced in forced marches. During the first two days roads were passable, but after that they became terrible, as it rained every day. In some places there were no roads left, nothing but mud and swamps. Once it took us a full hour to move one wagon, loaded with munitions and drawn by fifteen horses, a distance of only fifteen yards. . . . Horses sank into the mud up to their bodies and wagons up to their axles. . . . One night we reached a spot which was absolutely impassable. The only way to get around it was through a dense forest, but before we could get through there it was necessary to cut an opening through the trees. For the next few hours we felled trees for a distance of over five hundred yards. . . . For the past eight days we have been on the go almost every night, and once I stayed in my saddle for thirty consecutive hours. During

all that time we had no real rest. Either we did not reach our quarters until early in the morning or late at night. What a bed feels like we've forgotten long ago. We consider ourselves lucky if we have one room and straw on the floor for the seven of us. For ten days I have not been out of my clothes. And when we do get a little sleep it is almost invariably necessary to start off again at once. . . . Even our food supplies have become more scarce day by day. Long ago we saw the last of butter, sausage, or similar delicacies. We are glad if we have bread and some lard. Only once in a great while are we fortunate enough to buy some cattle. But then a great feast is prepared. . . . Tea is practically all that we have to drink. . . . The hardships, as you can see, are somewhat plentiful; but in spite of this fact I am in tiptop condition and feeling wonderfully well. Sometimes I am astonished myself what one can stand."

Early in October, 1914, the Germans came closer and closer to Warsaw. At the end of it they were in the south, within twenty miles of the old Polish capital—at Grojec. At that time only a comparatively small force, not more than three army corps, was available, under General Scheidemann's command, for its defense. These, however—all of them made up of tried Siberian troops—fought heroically for forty-four hours, especially around the strongly fortified little town of Blouie, about ten miles west of Warsaw. The commander in chief of all the Russian armies, Grand Duke Nicholas, had retired with his staff to Grodno, and Warsaw expected as confidently a German occupation as the Germans themselves. But suddenly the Russians, who up to that time seem to have underestimated the strength of the Germans, awoke to the desperate needs of the situation. By a supreme effort they contrived to concentrate vast reinforcements to the east of Warsaw within a few days and to change the proportion of numbers before Warsaw from five to three in favor of the Germans to about three to one in their own favor.

On October 10, 1914, panic reigned supreme in Warsaw. Although the Government tried to dispel the fears of the populace

by encouraging proclamations, the thunder of the cannons, which could be heard incessantly, and the very evident lack of strong Russian forces, spoke more loudly. Whoever could afford to flee and was fortunate enough to get official sanction to leave, did so. The panic was still more intensified when German aeroplanes and dirigibles began to appear in the sky. For fully ten days the fighting lasted around the immediate neighborhood of the city. Day and night, bombs thrown by the German air fleet exploded in all parts of the city, doing great damage to property and killing and wounding hundreds of innocent noncombatants. Day and night could be heard the roar of the artillery fire, and nightfall brought the additional terror of the fiery reflection from bursting shrapnel. The peasants from the villages to the west and south streamed into the city in vast numbers. Thousands of wounded coming from all directions added still more to the horror and excitement.

The hardest fighting around Blonie occurred from October 13 to 17, 1914. On the 13th the Germans were forced to evacuate Blonie, and on October 14 Prusakow, a little farther south and still nearer to Warsaw. On October 15 the Russians made a wonderful and successful bayonet attack on another near-by village, Nadarzyn. The next day, the 16th, saw almost all of this territory again in the hands of the Germans, and on the 17th they succeeded even in crossing the Vistula over a pontoon bridge slightly south of Warsaw. However, even then the arrival of Russian reinforcements made itself felt, for after a short stay on the right bank of the Vistula the Germans were thrown back by superior Russian forces. All that day the fighting went on most furiously and lasted deep into the night. The next day at last the Russian armies had all been assembled.

CHAPTER LXXVIII

GERMAN RETREAT FROM RUSSIAN
POLAND

ON October 19, 1914, the Germans, who apparently had accurate information concerning the immense numbers which they now faced, gave up the attack and began their retreat. The retreat was carried out with as much speed and success as the advance. By October 20 the Germans had gone back so far that the Russian advance formations could not keep up with them and lost track of them. Without losing a gun, the First German Army managed to escape the pursuing Russians as well as to evade two attempts—one from the south and one from the north—to outflank them and cut off their retreat.

During the fighting before Warsaw the total front on which the Russian armies were battling against the German and Austrian invaders of Poland was about 160 miles long, stretching from Novo Georgievsk in the north, along the Vistula, through Warsaw and Ivangorod to Sandomir at the Galician border in the south. All along this line continuous fighting went on, and the heaviest of it, besides that directly before Warsaw, took place around the fortress of Ivangorod. Two attempts of the Russians to get back to the left side of the Vistula on October 12 and 14, 1914, were frustrated under heavy losses on both sides. A German soldier states in a letter written home during the actual fighting before Ivangorod that at the end of one day, out of his company of 250, only 85 were left—the other 66 per cent having been killed or wounded.

Just as the Russians had succeeded in assembling sufficient reinforcements at Warsaw, to make it inevitable for the German forces to retreat, they had brought equally large numbers to the rescue of Ivangorod. However, these did not make themselves really felt there until October 27, 1914. Previous to that date the Germans and Austrians captured over 50,000 Russians and thirty-five guns. When, on October 23 and 24, 1904, aeroplane

scouts discovered the approaching vast reenforcements, and similar reports were received from the First Army fighting around Warsaw, the German and Austrian forces were all withdrawn. The retreat of these groups of armies was accomplished much in the same way as of that in the north, except that it began later and brought with it more frequent and more desperate rear-guard actions. The Russians, who were trying desperately to inflict as much damage as possible to the retreating enemy, showed wonderful courage and heroic disregard of death. In some places, however, the Germans had prepared strong, even if temporary, intrenchments, sometimes three or more lines deep, and the storming of these cost their opponents dearly.

By October 24, 1914, the invaders had been forced back in the south as far as Radom and in the north to Skierniewice; by October 28, Radom, as well as Lodz, had been evacuated and were again in Russian hands. The lines of retreat were the same as those of advance had been, namely, the railroads from Warsaw to Thorn, Kalish, and Cracow. Much damage was done to these roads by the Germans in order to delay as much as possible the pursuit of the Russians. Considerable fighting occurred, however, whenever one of the rivers along the line of retreat was reached; so along the Pilitza, the Rawka, the Bzura, and finally the Warta. By the end of the first week of November the German-Austrian armies had been thrown back across their frontiers, and all of Russian Poland was once more in the undisputed possession of Russia.

In a measure Von Hindenburg followed the example of his Russian adversaries when he withdrew his forces from Poland into Upper Silesia in November, 1914, after the unsuccessful first drive against Warsaw, of which we have just read the details. His reasons for taking this step were evident enough. When it had been established definitely that the reenforcements which Russia had been able to gather made futile any further hope of taking Warsaw with the forces at his command, only two possibilities remained to the German general: To make a stand to the west of the Vistula until reenforcements could be brought up, or to fall back to his bases and there concentrate enough additional

forces to make a new drive for Poland. He chose the latter, undoubtedly because it was the safer and less costly in lives.

How quickly the German retreat was accomplished we have already seen. In spite of their rapidity, however, the Germans found time to hold up the Russians, not only by severe rear-guard actions, but also by destroying in the most thorough manner the few railroad lines that led out of Poland. In this connection they proved themselves to be as much past masters in the art of disorganization as they had hitherto shown themselves to be capable of the highest forms of organization.

About November 10, 1914, Von Hindenburg had completed his regrouping. The line along which the Russians were massed against him stretched from the point where the Niemen enters East Prussia, slightly east of Tilsit, along the eastern and southern border of East Prussia to the Vistula at Wloclawek, from there to the Warta at Kola, where it turns to the west, along and slightly to the east of this river through Uniejow-Zdouska-Wola to Novo Radowsk. From there it passed to the north of Cracow in a curve toward Galicia, where strong Russian armies were forcing back the Austrians on and beyond the Carpathians. Along this vast front—considerably over 500 miles long—the Russians had drawn up forces which must have amounted very nearly to forty-five army corps, or over 2,000,000 men. These were distributed as follows: The Tenth Army faced the eastern border of East Prussia west of the Niemen; the First Army the southern border of this province, north of the Narew and both north and south of the Vistula; the Second, Fourth, Fifth, and Ninth Armies, forming the main forces of the Russians, fronted along the Warta against lower Posen and Upper Silesia, while the balance of the Russian armies had been thrown against the Austro-Hungarian forces in Galicia.

Against these Von Hindenburg had three distinct armies which were available for offensive purposes. The central army under General von Mackensen was concentrated between Thorn and the Warta River; a southern army had been formed north of Cracow and along the Upper Silesian border, and was made up chiefly of Austro-Hungarian forces with a comparatively slight

mingling of German troops. North of the Vistula, between Thorn and Soldau, a third and weaker army had been collected for the protection of West Prussia. In Galicia, of course, stood the main body of the Austro-Hungarian forces, and in East Prussia defenses had been prepared which made it possible to leave there weaker formations for defensive purposes only.

The Germans fully appreciated the danger of the Russian numerical superiority. If these mighty forces were once allowed to get fully under way and develop a general offensive along the entire front, the German cause would be as good as lost. The main object of Von Hindenburg, therefore, was to break this vast offensive power, and he decided to do so by an offensive of his own which, if possible, was to set in ahead of that of the Russians. Though the latter most likely had at least one-third more men at their disposal than he, he had one advantage over them, a wonderfully developed network of railroads, running practically parallel to this entire line. The Russians, on the other hand, had nothing but roads running from east to west or from north to south, which could be used as feeders only from a central point to a number of points along their semicircular line. Troops having once been concentrated could be thrown to another point if it was at any distance at all only by sending them back to the central point and then sending them out again on another feeder, or else by long and difficult marches which practically almost took too much time to be of any value. Von Hindenburg could, if need be, concentrate any number of his forces at a given point, deliver there an attack in force and then concentrate again at another point for a similar purpose, almost before his adversary could suspect his purpose. His plan was to attack with his strongest forces under Von Mackensen the weakest point of the Russian line between the Vistula and the Warta, beat them there and then march from the north against the right wing of the main forces of the Russians, which latter was to be kept from advancing too far by the mixed Austrian and German army. On his two outmost flanks, in East Prussia and East Galicia, nothing but defensive actions were contemplated.

The Russian plan was somewhat similar, except that their

main attack apparently was to be directed in the south against Cracow, and from there against the immensely important industrial center of Silesia. At the same time, they intended to press as hard as possible their attacks in East Prussia and Galicia in order to force a weakening of the German center.

CHAPTER LXXIX

WINTER BATTLES OF THE POLISH CAMPAIGN

DURING November and December, 1914, and January, 1915, much of the fighting which took place on this immense front consisted of engagements between comparatively small formations, and is very difficult to follow in detail. For convenience we shall consider first the fighting in Poland, and then separately that in East Prussia, although, of course, they were carried on concurrently.

On November 10, 1914, the Germans had reached Komn on the Warta, where it met a small Russian force, of which it captured 500 men and machine guns. Two days later, November 12, the Russians crossed the Warta, and their advance troops, chiefly cavalry, had almost reached Kalish on the East Prussian border. On that day, however, they were forced back again a short distance. Similar engagements took place at various points along the entire line, chiefly for the purpose of testing their respective strength.

November 14, 1914, however, saw the first more extensive fighting. Von Mackensen's group had reached by that time Wloclawek on the western bank of the Vistula and slightly east of the Thorn-Lowitz railroad, about thirty miles from Thorn. One of the Russian army corps of General Russky's group made a determined stand. However, it was forced to fall back and lost 1,500 prisoners and some ten machine guns. The Germans followed up this gain by pressing with all their power against the

right wing of the Russian center army. For two or three days the battle raged along a front running from Wloclawek south to Kutno, a distance of about thirty miles. Both of these country towns are situated on the strategically very important railroad from Thorn to Warsaw by way of Lowitz. The Russians had two or three army corps in this sector, including the one that had been forced back from Wloclawek. The Germans undoubtedly were in superior force at this particular point, and were therefore able to press their attack to great advantage. The final result was a falling back of the entire Russian right to the Bzura River after both sides had lost thousands in killed and wounded, and the Russians were obliged to leave over 20,000 men, 70 machine guns, and some larger guns in the hands of the Germans. Von Mackensen was rewarded for this victory by being raised to the rank of "general oberst," which in the German army is only one remove from field marshal.

In a measure separate battles in this Polish campaign sink, at this time, into insignificance. For the total number of men involved, the extent of the battle ground, the frequency of engagements which under any other circumstances would, without any doubt, have been considered battles of the first magnitude, stamped them at this time as "minor actions." The fighting, however, was as furious as at any time, the hardships as severe as anywhere, and the valor on both sides as great as ever. Again the wonderful mobility of the German army organization was one of the strongest features. A French critic says of the fighting in Poland at this time that "it was the most stirring since Napoleonic times. It forced generals to make movements and to change and improvise plans to an extent which war history never before had registered." Dr. Boehm, the war correspondent of the "Berliner Tageblatt," says that the advance was so fast that the infantry frequently had no time to lay down before firing, but had to do so standing or kneeling. Artillery most of the time moved on to a new position after having fired only a few shots. He also mentions the many cadavers of horses that could be seen everywhere. Some of these, of course, were the victims of rifle or gun fire. But more had a small round hole in their forehead

where the shot of mercy out of their own master's revolver had put them out of their misery. For the condition of the roads was such that, chiefly on account of the rapidity of the advance, large numbers of horses would fall down, weakened and often with broken legs.

Among one of the minor results of the battle of Kutno, necessitating the hurried withdrawal of the Russians, was the capture of the governor of Warsaw, General von Korff. He was surprised in his automobile by a troop of German cavalry toward which he was driving apparently in the belief that they were Russians.

During this period the Russians made an attack against the Germans between Soldau and Thorn. The left wing of this group was advancing along the right bank of the Vistula against Thorn, but was successfully stopped by the Germans at Lipno and thrown back in the direction of Plock. By November 16, 1914, the Russians had lost in that sector a total of about 5,000 prisoners with a proportionate number of machine guns. In general throughout the entire fighting in this territory the Russian losses by capture were astonishingly high. Of course, the Germans, too, lost men in this manner; but being in the offensive they suffered less, while the Russians, continually forced to fall back, often found it impossible to withdraw advanced formations in time. Further to the north the Russians had reached the border along the Warsaw-Danzig railroad. An attempt to cross and take Soldau, however, miscarried, and on November 18 they fell back for the time being on Mlawa.

By this time the Russian defense had stiffened. Von Mackensen was now well fifty miles within Russian territory. But for the next few weeks the Bzura was used with great success as a natural line of defense by the Russians.

From the 18th to the 30th of November, 1914, the fighting continued without pause along the entire line. In the north of the central group it centered around Plock, in the center of the same group around the important railroad junction Lowitz, and in the south once more around Lodz. One day would bring some advantages to the Russians, the next day to the Germans. Much of

this fighting assumed the character of trench warfare, though, naturally, not to the extent that this had taken place on the western front. By December 1, 1914, the troops under Von Mackensen fighting around Lodz and Lowitz claimed to have captured a total of 80,000 men, 70 guns, 160 munition wagons, and 150 machine guns. Still further down south the Austro-German group had much the same kind of work to do. The fighting there centered first around Czystechowa, and later around Novo Radowsk.

About the end of November, 1914, it looked for a time as if the Russians were gaining the upper hand. After they had fallen back to the Bzura, Von Hindenburg directed, with part of his left wing, an attack against Lodz from the north. Success of this move would mean grave danger to the entire central group of the Russians, the Warta Army. It threatened not only its right wing, but would also bring German forces in the back of its center and cut off its retreat to Warsaw. The Russian commander recognized the danger, and immediately began to throw strong reenforcements toward Lodz from Warsaw. To meet these Von Hindenburg formed a line from Lowitz through Strykow to Brzeziny. A Russian success would mean immediate withdrawal of these forces from their attack against Lodz, and possibly have even more important results. At the last moment the Russians brought up reenforcements from the south, and with them almost surrounded one of the German army corps which had advanced about ten miles to the southeast of Brzeziny to Karpin. For three days it looked as if this corps would either be annihilated or captured, but at last it succeeded in breaking through by way of Galkow to Brzeziny not only with comparatively small losses of its own, but with a few thousand of captured Russians.

For eighteen days the fighting lasted before Lodz. The Russians resisted this time most stubbornly. They had thrown up strong fortifications around the entire town, which they used as a base for continuous counterattacks.

As late as December 5, 1914, fighting was still going on, but finally that night the Russians made good their withdrawal, and

on the 6th the Germans were once more in Lodz. This was partly the result of an unsuccessful attempt on the part of the Russians to relieve Lodz from the south. Between the battle ground around Lodz and that on which the most southern Austro-German group under the Austrian General, Boehm-Ermolli, was fighting there was a slight gap. Through this—just west of Piotrkow—an attack could be made against the right wing of Von Mackensen's army. To meet this stroke a small separate army was formed under the command of the Austrian cavalry general, Von Tersztyansky, consisting of one German brigade, one Austro-Hungarian brigade, and a cavalry division. This shows the close cooperation which existed at that time between the forces of the Central Powers. This new army group took in the first days of December 19, 1914, some of the smaller places west and south of Piotrkow.

From then on until December 15, 1914, fighting went on day and night. One small village—Augustijnów—changed hands three times within one day—December 8, 1914—remaining finally in the possession of the Austro-Germans. In the evening of the 15th Piotrkow was finally taken by storm. This not only prevented any further attack against Von Mackensen's right, but also gave the Austro-Germans possession of the railroad from Cracow to Warsaw as far as Piotrkow, and secured to them the most important crossings over the Pilitza.

This long-continued fighting, lasting almost the entire twenty-four hours of every day and being accompanied by very severe artillery duels, spelled ruin to very many of the towns and villages involved; especially a large number of the latter in the immediate vicinity of Lodz suffered terribly. In many of them not a single house or hut was left standing, and thousands of Polish peasants, who even at the best had no superfluity of riches, were deprived of everything they possessed. Fire added to the terror; for most of the houses were covered with straw, and the destruction of one was usually quickly followed by the burning of all others within reach.

The losses of the Russians were not only very heavy in prisoners, but also in wounded and killed, although in the latter re-

spect the invading armies suffered almost as severely. Generals Scheidemann and Welitschko, both corps commanders, lost their lives, while it was reported that General Rennenkampf, who failed to come to the rescue of Lodz in time, was placed before a court-martial.

After Lodz had been occupied on December 6, 1914, Von Mackensen's army followed the retreating Russians. The latter offered the most stubborn resistance and a great deal of very close fighting took place. In many instances the Russian rear guard dug itself in wherever the ground offered possibilities to do so quickly and then frequently protected its positions with barbed wire. The storming of these of course caused the Germans heavy losses and delayed them sufficiently to allow the Russians to withdraw in good order.

For the possession of Lowitz, one of the most important railroad junctions west of Warsaw, the battle raged more than two weeks. It began as early as November 25, 1914, but it was not until about December 15, 1914, that the Russians gave up this point. They had thrown up very strong fortifications on all sides of the town and the Germans under General von Morgen had to bring up a strong force of artillery before they could reduce the place. The result was that this little town which had been in the thick of the fighting so many times was finally almost entirely destroyed and the outlying countryside became a scene of the most complete and terrible devastation.

Some of the most violent fighting before Warsaw occurred at this time along the upper Bzura and its southern tributary, the Rawka. The Russian line ran now almost straight from the influx of the Bzura into the Vistula, along the east bank of the former through Sochaczew, then along the east bank of Rawka through Skierniewice and Rawa, from there along some hills to the river Pilitza, crossing it at Inowolodz, through Opoczno and along the River Nida to the Vistula and beyond it through Tarnow into Galicia. In spite of their strong intrenchments and their heroic fighting the Russians were gradually, though very slowly, forced back. A great deal of this fighting was trench warfare of the most stubborn type. This necessarily

meant that for weeks the line wavered. One day the Germans would force a passage across one, or perhaps all, of the rivers at one or more points, only to be thrown back the next day and to have the Russians follow their example with an offensive excursion on the west bank. These continually changing "victories" and "defeats" make it next to impossible to follow in full all the developments along this line. By December 25, 1914, the Germans held Skierniewice; by December 27, 1914, Inowłodz; by January 3, 1915, Rawa; by January 5, 1915, Bolimow.

Throughout the entire month of January, 1915, the most ferocious fighting continued around all these places, and many of them changed hands two or three times. Both sides very freely used the protecting darkness of night to make attacks, and this naturally added a great deal to the hardships which the troops had to suffer. It must also not be forgotten that by this time winter had set in in earnest. Snow covered the ground and a very low temperature called for the most heroic endurance on the part of everybody.

One of the American war correspondents, who at this time was with the Russian forces before Warsaw, gives a very vivid description of a night cannonade in the neighborhood of Blouie: "The fire of the German cannons is unbearable. Night grows darker and darker. Everywhere, in a great circle, the country is lighted up by camp fires which send their flames toward heaven in a cloud of smoke. These little red spots throw everywhere a fiery glow over the snow, and down upon this wonderful color symphony the moon pours its weak, ghostlike light through a curtain of clouds so that people seem to float away as in a dream. In the foggy twilight three battalions march to the front. . . . The noise of the gunfire penetrates to us in separate, spasmodic outbreaks. Flashes of fire flare up on the horizon. . . . Gradually we come closer and closer to the firing line. Now we are only two or three miles away from the firing batteries. We turn toward the west and there a magnificent battle panorama lies before our eyes. The moon sheds just enough light through the clouds to make it possible to recognize the shadows on the snow. The flat, white field is lined with a seam of black trees. Behind these thin

woods stand the cannons. They stretch out in a long line, as far as the eye reaches, and their irregular positions are shown by the red tongues of fire which flare up again and again. The noise of the battle, which had sounded all around us, has now swollen into the roaring thunder of cannons. At a short distance, where the sky seems to touch the field, other flashes flare up, these are the German cannons. Sometimes as many as four of these flashes break forth at one time and tear the dull twilight with their glaring brightness. For a moment all the surrounding country with its phantastic shadows and its daring lights is submerged in blinding brilliancy; then another glittering light captures the eye. It is a bursting rocket which breaks up into thousands of little stars and illuminates the vast field of snow everywhere so that it glitters and glares.

"But again another light appears in the dusky sky. A spray of gold! That is an exploding shrapnel, and almost at the same point three more of these missiles burst into their reddish golden glow. Then the giant arm of a searchlight is thrust out into the midst of the foggy, swelling atmosphere and shows houses, fences and paths with an unsparing clearness. Irresolutely the mighty finger of light wanders across the plain as if it were searching for something and could not find it. At last it throws its coldling, shining ray on a defile and rests there. And suddenly out of the darkness there flares up a multitude of little flashes which look from the distance as if innumerable matches were struck and gave off sparks. The sparks run in a straight line, and these bounding lights show the position of the trenches. Another line of sparks puts in appearance, seemingly only a short distance away. That is formed by the battalions of the advancing, attacking enemy. Then suddenly a ribbon of flame cuts through the shadows, and the sharp echo of machine guns bites into the night air. But so immensely far spreads the battle panorama that the eye is able to fix only small sections at a time. . . ."

Among the many small villages and towns in this small sector between Warsaw and Lowitz, Bolimow saw the most furious fighting. Almost step by step the Russians fought here

the German advance, and when finally they gave way for a mile or less after days and nights of grueling fighting, they did so only to throw up immediately new defenses and force the invaders to repeat their onslaught again and again. At any other time of the year this part of the country would have yielded little ground for fighting; for it is covered extensively with swamps. But now the bitter cold of midwinter had covered these with ice solid enough to bear men and even guns. On January 28, 1915, the Germans at last threw the Russians out of their strong intrenchments at Bolimow. But others had already been prepared a short distance to the east, at a small village, Humin.

The attack on this particular position began in the morning of the last day of January, 1915. For three days the battle raged until, late in the afternoon of February 2, 1915, the Germans took Humin by storm. At times it is difficult to decide whether battles involving vast fronts and equally vast numbers, or those fought in a small space and by comparatively small numbers are the more heroic and ferocious. In the latter case, of course, individual valor becomes not only much more noticeable, but also much more important and details that are swallowed up by the great objects for which great battles are usually fought stand out much more clearly. It will, therefore, be interesting to hear from an eyewitness, the war correspondent of one of the greatest German dailies, the "Kölnische Zeitung," what happened during the three days' battle of Humin:

"It was seven o'clock in the morning of January 31, 1915. Punctually, in accordance the orders given out the previous evening, the first shot rang out into the snowy air of the gray morning at this hour from a battery drawn up some distance back. Like a call of awakening it roared along, and fifteen minutes later when it had called everyone to the guns—exactly to the minute the time decided on by general orders—the battle day of January 31, 1915, began with a monstrous tumult. With truly a hellish din the concert of battle started. A huge number of batteries had been drawn up and sent their iron "blessing" into the ranks of the Russians. Field batteries, 15-centimeter

howitzers, 10-centimeter guns, 21-centimeter mortars, and, to complete the wealth of variety, 30-centimeter mortars of the allied Austrians joyfully shouted the morning song of artillery. A dull noise roared around Bolimow, for in back of the town, before it, to the right and to the left, stood the various guns in groups of batteries, and through the air passed a shrill whistle. But it was not only their hellish din which made one tremble and start up, but even more so the dismal, powerfully exciting howl of the gigantic missile of the great mortars, chasing up and way into the air almost perpendicular. It sounded each time as if a giant risen from out of the very bowels of the earth sent up great sobs. Like a wild chase of unbridled, unchained elements the powerful missile shot up high from the gun barrel.

"A shriek of the most horrible kind, a trembling and shaking started in the wildly torn air, a continual pounding, hissing whirlwind shot up like a hurricane, lasted for seconds and disappeared in the distance like some monstrous mystery. Surrounded by a glare of fire, encircled by blinding light, licked by sheaves of flames, the short barrel of the mortar drew back at the moment of firing. Clouds of dust rose; they mixed gray with brown, with the smoke of gunpowder which hid from sight for a few moments the entire gun, and then it rained down from the air, for whole minutes, the tiny pieces into which the cover of the charge had been torn. After every shot of the big mortars, the heavy howitzers and the 21-centimeter mortars—which usually are the loud talkers in an artillery battle—could hardly make themselves heard. An entire battery of them could not drown the noise of *one* shot from an Austrian mortar. It sounded like a hoarse but weak bark as compared with this gigantic instrument of death and destruction.

"During the morning the sky cleared; this enabled the observers to sight more accurately. Orders were sent over the telephone; the telescope controlled the effect of the gunfire, and one could see plainly how, in a distance of a few miles, the hail of shot descended on the enemy's trenches. 'Way up towered the geysers of earth when the shot struck home. Above the Russian trenches lay a long white cloud of powder forming a great wall of waves.

The dull thunder of the guns was tremendous. It whistled and howled, it cried and moaned, it roared like the surf of the ocean, like the terrifying growl of a thunderstorm, and then it threw back a hundredfold clear echo. In between came the dull crack of the Russian shrapnel. They broke in the broad, swampy lowlands of the Rawka; they pierced the cover of ice which broke with a tremendous noise while dark fountains of bog water gush up from the ground. In front and in back of the German batteries one could see the craters made by the Russian hits; they were dark holes where the hard frozen ground had been broken up into thick, slaglike pieces weighing tons and all over the white cover of snow had been strewn, dark brown and as fine as dust, the torn-up soil.

"Then the storm of the trenches set in. At a given hour the roar of the guns stopped suddenly. A few minutes later the masses of infantry, held in readiness, arose. They came up from their trenches, climbed over their walls, sought cover wherever it could be found, and were promptly received by rifle and machine-gun fire from the Russians. That, however, lasted only a moment; then they advanced in a jump; the attacking line thinned out, stretched itself out and, continuously seeking cover, tried to advance. A few minutes only and the first Russian trench line was reached. In storm, with bayonet and rifle butt, they came on and broke into the trenches. They were fighting now man for man. Then the artillery fire set in again. Again in the afternoon the infantry advanced in storm formation against the head of the village and the trenches flanking it. From them roared rifle and machine-gun fire against the storming lines. Nothing could avail against these intrenchments. Again artillery was called upon to support the attack.

"It was now five o'clock in the afternoon on January 31, 1915, and the artillery fire still roared over the white plain. Here and there were a few scattered farms, deeply snowed in. In the distance stood forests, darkly silhouetted against the sky, covered with heavy, low-hanging snow clouds. In between were yawning depths, and farther up other curtains of clouds glowing

in the full purple light of the setting sun. A wonderful majesty lay on the heavens at that hour. But down on the earth, across the white plain, the fighting German troops still crowded against the enemy. Again infantry fire started and became the livelier the nearer twilight approached and the deeper evening shadows prepared the coming night.

"The 1st of February, 1915, the second day of battle, broke damp and cloudy. Once more artillery fire set in. Later in the morning, just as on the first day, the infantry again attacked. While the roar of the battle went on, some of the men prepared the last resting place for their comrades who had fallen on the previous day. Silently this work was done. Here there were single graves, and then again places where larger numbers were to be put to rest together. One such grave was dug close to the wall of the cemetery and in it were bedded the dead heroes so that their closed eyes were turned westward—toward home. A chaplain found wonderful words at the open grave, blessing the rest of those who had fallen on the field of honor and speaking to their comrades of the joys of battle and of its sorrows while they said farewell to the dead with bared heads.

"The guns still roared; then they were silent and then roared on again. A remarkable tension was in the air. In a discord of feelings the day drew to its end, and after that the third day of battle, the 2d of February, dawned with renewed fighting. It was noon. We were sitting at division headquarters, lunching, when the telephone rang loudly. With a jump a staff officer was before it. 'General, the Russians lines are giving way.' Quickly the general issued his orders. Once more the fighting set in with all the available strength and vigor. The thunder of the guns was renewed, and so the third day of battle ended with the storming of the strong Russian positions in Humin and with the occupation of the entire village by the German troops."

After the storming of Humin the Germans took the heights near Borzimow, which commanded the road Bolimow-Warsaw. Here, too, the fighting was very hard. South of Humin, near Wola-Szydlowieca, the Russian lines again were broken on February 3, 1915, after a combined artillery and infantry attack,

which began early on February 2, 1915, and lasted for more than twenty-four hours. The next ten days brought continuous fighting at many points, some of it almost as ferocious as that of which we have just spoken, but none of it yielding any important results to either side. With the middle of February a lull set in in this sector of the front. Of course the fighting did not stop entirely. But the Germans did not advance farther, and the Russians were unable to break their lines or to force them back anywhere to any appreciable extent.

Of course all this fighting took place near enough to Warsaw to be heard there and to fill its inhabitants with terror and fear of a possible siege or attack on the city proper. Although a great many people had fled to the interior, thousands of others had flocked to the city, especially from those outlying districts that had been overrun by the invaders. Most of these were practically destitute and without means or opportunity to earn any money. The Russian Government did its best to help them, and provided nineteen asylums and thirteen people's kitchens which, it is reported, distributed each day 40,000 portions. Wood, coal, and oil gradually became more and more scarce and advanced to very high prices, causing a great deal of suffering, especially among the poorer classes.

Again reports of various neutral war correspondents, located at that time in Warsaw, are of great interest. Says one: "The thunder of the cannons has started up once more. Only the forts of the belt line of fortresses are still silent. The railroad to Wilanow has been closed. No one is allowed to go beyond Mokotow. In front of the two railroad stations silent crowds of people are standing, their features showing their terror. They stand there like they would at a fire to which the firemen are rushing with their engines and ladders. One's feet are like lumps of ice, one's head feels foolish and empty. Doors and windows in the big new houses in Marshalkowska Street have been boarded up in expectation of the rifle fire. It reminds one of a boat when, before the breaking of the storm, hatches are closed up and sails are trimmed. Omnibuses come in loaded with wounded, likewise butcher wagons with similar loads. Many of the lighter

wounded soldiers limp on foot. With nightfall the entire city falls into darkness—strange, ghostlike. People creep along the walls with bowed heads. The silence of the night only intensifies the roar of the untiring guns, and they seem then to come closer."

During all this time the German dirigibles and aeroplanes were very active, too, throwing bombs. Granville Fortescue pictures the terror spread by them most realistically. "Warsaw's inhabitants know now well the meaning of an aeroplane, and whenever they see one approach they run in wild terror into their houses and cellars. Before every open door pushing, shouting crowds mass themselves, and serious panics are caused when the sharp crack of the exploding bomb shakes and rattles all the windows. As soon as the danger is passed the curious collect, first with hesitation, then bolder and bolder, around the spot where the bomb fell and gape with terror at the powerful results produced by the explosion. Here a stretch of the railroad has been destroyed; the walls of the near-by houses are covered with innumerable holes looking like smallpox scars; others, of the splinters from the bomb, have dug themselves deep into the ground and not a single window in the vicinity is unbroken."

A winter of the most bitter misery has closed in on the unfortunate city; miserable-looking shapes by the thousands, without home or food, crowd the narrow, crooked streets. As sand flows through an hourglass, so regiment after regiment, from every part of the vast empire of the czar, streams through the streets which now are black with people. From far-distant Siberia and from the borderlands of Turkestan these red-clad soldiers pour through Warsaw to the plains of Poland. In their dull features no trace can be discovered of what they feel or think. One can study the faces of these Tartars, Mongols, and Caucasians as much as one pleases, there remains always the same mystery. Tramp, tramp, tramp—they march from the Kalish station along the railroad until they disappear together with the horizon in a single gray mass—who knows whither, who knows whence? It is at such times that one realizes the magnitude of

Russia if one considers that many of them have traveled all the way from the Ural Mountains.

Quietness and gloominess now reign in Warsaw's hospitals, in which formerly there was so much life and activity. The patients have been sent, as far as their condition permitted, into central Russia to recuperate, and at this time only slightly wounded men are brought in. This is a bad sign, for the doctors figure correctly that it indicates that those seriously wounded are left on the battle fields and perish there. The hotels, on the other hand, are full of life. There officers have settled down; every rank and every branch of the service is represented here, from the grizzly general down to the beardless lieutenant; every province of the immense empire seems to have sent a representative. You may see there the most fantastic figures: Caucasian colonels with enormous caps, huge mustaches, and black boots, figures which look still exactly like the Muscovian warriors from the days of Napoleon. It strikes one as very strange to hear so many German names borne by these Russian officers. And while the poor inhabitants of Warsaw await their fate with fear and trembling, the officers are the only ones full of joy, for war is their element and a promising opportunity for thousands of enticing possibilities which peace never brought them.

During November and December, 1914, both in north and south Poland, continuous fighting went on along the lines. In south Poland the field of action was at first north of Cracow, between the Rivers Warta and Pilitza, and later between the latter and the River Nida. But although the result of this fighting—which mainly was in favor of the German-Austrian forces—to a certain extent influenced the result in the central sector to the west of Warsaw, the details of it do not properly call for consideration at this time and place. For it was directed much more by the Austrian General Staff than by that of the German armies, the forces involved were preponderantly Austro-Hungarian, and it was much closer connected with the Russian attack on Galicia and the Carpathians than with Von Hindenburg's attack of the Russian center. It will find its proper consideration in another place in connection with the Galician campaign.

Suffice it to say here that the Austro-Hungarian forces under Boehm-Ermolli, supported by the German division under General van Woyrsch, carried successfully that part of Von Hindenburg's general plan which had been assigned to it—the protection of the right wing of his central group of troops and the shielding of Cracow from a direct Russian attack.

To the north of the central group—north of the Vistula and between it and the Narew—the Germans had assembled, as we have already stated, another group which had as its bases Soldau and Thorn. Their chief task was to protect the German provinces of West and East Prussia from a Russian attack from Novo Georgievsk and Warsaw.

During November, 1914, these forces restricted themselves entirely to defensive fighting along the border. With the beginning of December, however, when the Russians had temporarily weakened their forces fighting north of the Vistula in order to send additional support to the defenders of Warsaw, the Germans attempted an advance which for a short time was successful.

On December 10, 1914, Przasnysz, about twenty-five miles southeast of Mlawa, was stormed after the latter place had been occupied some time before. By December 15, 1914, however, the Russians had again stronger forces at their command for this part of the front, and with them they not only threw the Germans again out of Przasnysz, but forced them to evacuate Mlawa and retire behind their border. A week later, about December 22, 1914, the Germans again advanced from Soldau and Neidenburg, and by December 24, 1914, Mlawa once more was in their hands. Although the fighting in this sector practically went on without intermission from the beginning of November, 1914, to the end of February, 1915, comparatively small forces were involved on both sides. This, of course, excluded any possibility of a decisive result of either side, and we can therefore dismiss this end of the campaign with the statement that, although the Germans north of the Vistula were more successful in keeping the Russians off German soil than the Russians were in keeping the Germans out of Poland, the lat-

ter did not make here any appreciable headway in the direction of Warsaw, and accomplished no more than to keep a goodly number of Russian regiments tied up in the protection of Novo Georgievsk and the northern approach to Warsaw instead of permitting them to participate in the repulse of the main attack against the Polish capital, where they would have been very useful indeed.

CHAPTER LXXX

WINTER BATTLES IN EAST PRUSSIA

THE most northern part of the eastern front is now the only one left for our consideration. We have already learned that when the German General Staff planned its second drive against Warsaw, it had been decided to restrict the German forces collected in East Prussia south of the Niemen and east and south of the Mazurian Lakes to defensive measures. At that time—the beginning of November, 1914—and until about the beginning of February, 1915, they consisted of two army corps under the command of General von Bülow, who at the outbreak of the war and for a few years previous to it had been in command of a division with headquarters at Insterburg, and who was therefore well qualified for his task through his intimate knowledge of the territory. About 50 per cent of his forces belonged to the Landwehr, about 25 per cent to the Landsturm and only about 25 per cent were of the first line. These faced a numerically very superior force variously estimated at five to seven army corps. The Germans therefore found it necessary to equalize this overpowering difference by withdrawing behind a strong natural line of defense. This they found once more behind the greater Mazurian Lakes to the south and behind the River Angerapp which flows out of the lakes at Angerburg to the north until it joins the river Pissa slightly to the east of Insterburg.

These positions apparently were prepared during the early part of November, 1914. For as late as November 15, 1914, fight-

ing took place at Stallupoehnen on the Kovno-Königsberg railroad and some ten miles east of the Angerapp. A few days earlier, on November 9, 1914, a Russian attack, still farther east, north of the Wysztiter Lake, had resulted in considerable losses to the Russians. North of the Pissa River the Germans managed to stick closer to their border, along which there flows a small tributary of the Niemen offering natural protection. Considerable fighting took place in this territory around the town of Pillkallen, but the German line held.

On November 30, 1914, the Russians had again occupied that part of East Prussia located between the border and the Mazurian Lake-Angerapp line. On that day the first of a long series of attacks against this very strong line was made east of Darkehmen, but was as unsuccessful as all its successors. The German Emperor saw some of this fighting during a short visit to the East Prussian defenders. All through December, 1915, the Russians made repeated attacks against the German lines, always without accomplishing their object of breaking through it and advancing again against Königsberg. Of course, they inflicted severe losses on their adversaries, though their own, both in disabled and captured, were much more severe, due to the disadvantages which the difficult territory heaped upon the attacking side. By the beginning of January winter had set in in full earnest and the weather became so severe that no fighting of any importance took place throughout the entire month. The only exceptions were Russian attacks about January 15, 1915, against Loetzen, the German fortress on the eastern shore of the northernmost group of the lakes, which, however, brought no results. At the same time Gumbinnen was once more the center of considerable fighting.

Later in the month, January 26, 28, and 29, 1915, this town again and again had to pay dearly in additional destruction of what little of it that was still left of its former prosperity for the advantage of being located on the Königsberg road. On January 30, 1915, the Russians attempted to break through a little further south at Darkehmen—but still the German lines held.

In the meanwhile new troops had been prepared and collected

and were being rushed to that part of the east front for the purpose of clearing all of East Prussia of its invaders. These reenforcements were sent to the right and left wings of the Mazurian Lakes-Angerapp line, and the former began its attack in February. A few days before an exceptionally heavy snowfall, accompanied by very high winds and very low temperatures, had set in. This not only added to the hardships of the troops, but increased immensely the difficulties with which the leaders on both sides had to contend. On account of the weather the roads became impassable for motor cars and the railroads were hardly in better condition. At no time could a general count with any amount of certainty on the prompt execution of movements. Trains were delayed for hours and regiments appeared in their allotted positions hours late.

The right wing of the German front was sent around the southern end of the lake chain by way of Johannsburg. There the Russians had thrown up very strong fortifications in connection with the dense forests surrounding this town. To the southeast the river Pisseck forms the outlet for one of the lakes and flows toward the Narew. This line, too, was held by the Russians, who had considerable forces, both in Johannsburg and to the east in Bialla. In the late afternoon and during the night of February 8, 1915 a crossing over the Pisseck was forced and Johannsburg was stormed. Russian reenforcements from the south—Kolno—arrived too late and were thrown back with considerable losses in men and guns. In spite of the bitter cold the Germans pressed on immediately. They took Bialla on February 9, 1915, and then immediately pushed on to Lyck with part of their forces. This town, like so many other East Prussian towns, had suffered cruelly, having been in the thick of the fighting almost from the beginning of the war. Now the Russians again made a most determined stand in its vicinity, induced, no doubt, chiefly by the defensive advantages which the territory offered here. To the west of Lyck, beyond the Lyck Lake, they had built up very strong intrenchments which resisted all German attacks for days, and it was not until the middle of February, 1915, that they gave up these positions. But even then they con-

tinued to hold Lyck itself, and it was not taken until after the middle of the month. The other part of the right wing in the meantime had forced the Russians out of the southeast corner of East Prussia and was advancing against Grajeko and Augustovo.

In the north the German left wing had pushed its advance simultaneously, starting from around Tilsit and the Niemen line. The Russians fell back on strongly prepared intrenchments along the line Pillkallen-Stallupoehnen, but by February 10, 1915, they had to give up this line and withdraw still farther south and east toward Eydtkuhnen, Kibarty, and Wirballen, all places of which we heard considerable during the previous battling in East Prussia. It was snowing furiously and the Russians apparently counted with too much certainty on this as a means of keeping the Germans from following closely. They procured quarters in these three towns and were going to enjoy a much needed rest for one night. But during that night the Germans, overcoming all difficulties of snowdrifts and impassable roads, attacked and stormed Eydtkuhnen as well as Wirballen and killed, wounded, or made prisoners almost all the Russian forces located there, amounting to about 10,000 men with considerable artillery and even greater quantities of supplies. Gumbinnen also was retaken by the Germans and by February 12, 1915, they were on Russian territory and advancing once more against Suwalki.

By the middle of February the last Russian had been driven out of Germany. This series of battles, known commonly as the "Winter Battle of the Mazurian Lakes" not only freed East Prussia, but yielded comparatively large results in the numbers of prisoners taken. In nine days' fighting about 50,000 men, 40 guns, and 60 machine guns were captured. Both sides, of course, suffered also heavy losses in killed and wounded. These great battles here briefly summarized to round out the account of the operations of the first six months are described in greater detail in Volume III.

CHAPTER LXXXI

RESULTS OF FIRST SIX MONTHS OF
RUSSO-GERMAN CAMPAIGN

THIS brings us approximately to the end of the first six months' fighting at the eastern front. It will be well now to pause for a short space of time and to sum up the results of the tremendous conflict which has been narrated. However, before we consider these results from a military point of view and strike the balance of successes achieved and failures suffered, let us see how they affected those who were the actors in this terrible tragedy of mankind—the men who fought these battles and their leaders, and the poor, unfortunate men, women, and children whose habitations had been thrown by an unkind fate into the path of this vortex of death and destruction.

In determining the total losses which the Russian and German forces suffered during the first six months of the war, it is next to impossible to arrive at this time at absolutely correct figures. This is especially true in regard to the German troops. In a way this sounds strange, for the German talent for organization made itself felt in this respect, just as much as along other lines, and in none of the countries involved were the official lists of losses published as rapidly, frequently, and accurately as in Germany, especially in the early stages of the conflict. However, these lists included the German losses on all fronts as well as on the seas, and therefore are available for our purposes only as a basis for a computation of average losses. But by taking these totals and comparing them with other figures from various sources—newspapers, official Russian reports, English and French computations (non-official), statistics of the International Red Cross, etc.—it is possible to determine a total per month of German losses of all kinds—killed, wounded, missing, and captured—for all fronts on which German forces were fighting during the first six and a half months of the war. This total is 145,000 men per month. Assuming that all in all the losses were about evenly di-

vided on the western and eastern fronts, and disregarding the comparatively small losses of the navy, we get a monthly average of German losses at the eastern front of 72,500 men, or a total for the entire period of 471,250 men. This does not include those wounded who after a varying period of time were again able to return to the fighting, and whose number of course was very large, but represents the number of those whose services had been lost to the German forces for all time.

In the case of the Russian losses it is somewhat easier to arrive at fairly accurate figures, at least as far as their losses through capture are concerned. For the official German figures in this respect go into great detail and undoubtedly may be accepted as generally correct. During the early part of the war when the Russians were fighting along the border and on East Prussian territory they lost 15,000 officers and men by capture, at Tannenberg 90,000, and immediately afterward in the Lake district 30,000 more. In October, 1914, fighting in the province of Suwalki, during Hindenburg's advance to the Niemen and his retreat, he captured 10,000, and by November 1, 1914, there were according to the official German count 3,121 officers and 186,797 men in German prison camps. By January 1, 1915, this number had increased to 3,575 and 306,294 respectively, and by the middle of February the total in round numbers must have been at least 400,000. That this is approximately correct is proven by the statement of the Geneva Red Cross published in the "Journal de Genève," which gives the total of Russian prisoners in the hands of the Central Powers by the end of February as 769,500. According to the same source the Russians had lost by that time in killed 743,000 and in totally disabled 421,500, while their slightly wounded—those who finally returned again to the active forces—reached the huge total of 1,490,000. These figures again are for the entire Russian forces, those fighting against German as well as Austro-Hungarian forces. Just what proportion should be assigned to the Russian forces fighting against the Germans is rather problematical. For while these were fighting on a much larger front than those who had been thrown against Galicia and the Bukowina, the

latter were comparatively much more numerous and, therefore, probably suffered proportionately larger losses. Some of the losses also occurred in the fighting against Turkey. However, we will be fairly safe—most likely shooting below rather than above the mark—in estimating one-half of all these losses as having been incurred on the Russo-German front. This, then, would give us for the period of August 1, 1914, to February 15, 1915, the following total Russian losses in their fighting against the German forces: Killed, 371,500; totally disabled, 210,750; captured, 384,750, a grand total of 967,000, or about twice as much as the German losses.

Even these figures, without any further comment, are sufficient to indicate the terrible carnage and suffering that was inflicted on the manhood of the countries involved. But if we consider that every man killed, wounded or captured, after all, was only a small part of a very large circle made up of his family—in most cases dependent on him for support—and of his friends, even the most vivid imagination fails to give proper expression in words of the sum total of unfathomable misery, broken hearts, spoiled lives, and destroyed hopes that are represented in these cold figures.

At various points in our narrative we have had occasion to speak of the various generals, both Russian and Germans, who were directing these vast armies, the greatest numerically and the most advanced technically which mankind has ever seen assembled in its entire history. To go into details concerning the hundreds of military geniuses which found occasion to display the fruits of their training and talent would be impossible. But on each side there was among all these leaders one supreme leader on whose ability and decision depended not only the results of certain battles, but the lives of their millions of soldiers—yes, even the fate of millions upon millions of men, women and children. The Russians had intrusted their destiny to a member of their reigning family, an uncle of the czar, Grand Duke Nicholas, while the Germans had found their savior in the person of a retired general, practically unknown previous to the outbreak of the war, Paul von Hindenburg. Each had

been put in supreme command, although the former's burden was even greater than that of the latter, including not only the Russian forces fighting against the Germans, but also those fighting against the Austro-Hungarians. On both, however, depended so much that it will be well worth while to devote a short space of time to gain a more intimate knowledge of their appearance, character and surroundings. We will spend, therefore, a day each at the headquarters of these two men by following the observations which some well-known war correspondents made during their visits at these places.

The war correspondent of the London "Times" had occasion during his travels with the Russian armies to make the following observations: "Modern war has lost all romance. The picturesque sights, formerly so dear to the heart of the journalist, have disappeared. War now has become an immense business enterprise, and the guiding genius is not to be found on the firing line, any more than the president of a great railroad would put on overalls and take his place in an engine cab. Here in Russia the greatest army which ever met on a battle field has been assembled under the command of one individual, and the entire complicated mechanism of this huge organization has its center in a hidden spot on the plains of West Russia. It is a lovely region which shows few signs of war. In a small forest of poplars and pines a number of tracks has been laid which connect with the main line, and here live quietly and peacefully some hundreds of men who form the Russian General Staff. A few throbbing autos rushing hither and thither and a troop of about 100 Cossacks are apparently the only features which do not belong to the everyday life of the small village which is the nearest regular railroad station. Many hundreds of miles away from this picture of tranquillity is stretched out the tremendous chain of the Russian front, each point of which is connected with this string of railroad cars by telegraph. Here, separated from the chaos of battle, uninfluenced by the confusion of armed masses, the brain of the army is able to gain a clear and free view of the entire theatre of war which would only be obscured by closer proximity."

Another, a French, correspondent, says: "Whatever happens anywhere, from the Baltic Sea to the Carpathian Mountains, is known immediately in the big blue railroad cars whose walls are covered with maps. Telegraph and telephone report the most minute occurrence. Should the commander in chief desire to inspect a position or to consult personally with one of the commanding generals there is always an engine ready with steam up. Headquarters suddenly rolls off; and, after two or three days, it returns noiselessly, with its archives, its general staff, its restaurant, and its electric plant. The Grand Duke rules with an iron fist. Champagne and liquor is taboo throughout the war zone, and even the officers of the general staff get nothing except a little red wine. Woe to anyone who sins against this order, here or anywhere else at the front. The iron fist of the Grand Duke hits, if necessary, even the greatest, the most famous. At a near-by table I recognize an officer in plain khaki, Grand Duke Cyril. The proud face and the powerful figure of the commander in chief, Grand Duke Nicholas, is sometimes to be seen in this severe room. Shyly one approaches the chief commander upon whose shoulders rests all the responsibility; and the attitude of the man who has been chosen to lead the Russian armies to victory does not encourage familiarity. Next to him I notice Janushkewitsh, the Chief of the Great General Staff, with the gentle, almost youthful face of a thinker. But everything is ruled by the personality of the Grand Duke, which, with its mixture of will power and of gracious majesty, is most captivating."

Let us now rush across space and follow still another war correspondent, this time a representative of the German press, to the headquarters of the German armies: "Field Marshal von Hindenburg has an impressive appearance. With his erect, truly military carriage he makes a picture of strength and health. With him appears a very young-looking general who cannot be older than fifty years. A high forehead, clear blue eyes, a powerful aquiline nose, an energetic mouth, a face—in one word—which would be striking even if the man, to whom it belongs, would not be wearing a general's uniform and the

insignia of the order 'Pour le mérite'—one knows that one is face to face with the chief of the General Staff, Ludendorff. The Field Marshal greets his guest with charming friendliness, leads the way to the table and offers him the seat to his right. During the simple evening meal he rises and offers the toast: 'The German Fatherland!' Around the table are about ten officers, among them Captain Fleischmann von Theissruck of the Austrian army, who represents the Austrian General Staff. The Field Marshal mentions a letter which he received from some one entirely unknown to him in which the writer reproaches him most severely because some Cossacks had entered some small town on the border. 'That will happen again and again,' he says, 'and cannot be avoided. I cannot draw up my troops along the entire border, man by man, like a quarantine guard. To gather forces quickly again and again and to beat the Russians again and again, that is the best way to make them disgusted with their stay at the German border.' Then he relates some details about the battle of Tannenberg. He does not tire of entertaining his guest with interesting details about the fighting. He mentions the vast number of presents which have been sent to him by his numerous admirers. 'It is touching how good people are to me. A great many of their gifts are very welcome—but what shall I do with framed pictures while I am in the field? What shall I do after the war is over? Nothing. I'll go back to Hanover. There are lots of younger men [pointing to Ludendorff and the others] who want their chance, too. With my years, there is nothing more beautiful than to retire after one's work has been done and to make room for the younger generation.' "

Apparently the men at the "helm of the ship" lead a life of comparative ease and security. But if we consider the fearful responsibilities that they have to carry and the tremendous mental strain under which they are continuously, we can readily see that their lot is not to be envied. Of course, their rewards are equally great if they are successful. But what if they fail? At any rate they, as well as the troops who fight under them, have the clamor of fighting, the promise of glory, the sense

of duty well done, to sustain them. But what of those others, equally or even more numerous, on whose fields and forests, in whose streets and market places, around whose houses and churches the battles rage and the guns roar? What of the women and children, the sick and the old, whose fathers, husbands and sons are doing the fighting or, perhaps, have already laid down their lives upon the altar of patriotism? What is there left for them to do when they see their houses go up in flames, their few belongings reduced to ashes, their crops destroyed and even their very lives threatened with death and sometimes—worse yet—with dishonor?

All this and more millions upon millions of Russians and Germans, rich and poor alike, had to suffer most cruelly. And on the eastern front this suffering in a way, perhaps, was even more severe than in the west. For there the actual fighting, while extending over an equally long front, was much more concentrated, and after the first few months did not move forward and backward; and existence, except in the immediate vicinity of the firing line, was at least possible, even if dangerous and precarious. But in the east thousands upon thousands of square miles in East Prussia, in West Prussia, and especially in Poland, the fighting passed in ever advancing and retreating waves as the surf rolls along the beaches, and soon gunfire and marching millions of armed men had leveled the country almost as smoothly as the waves of the ocean grind the sand.

In East Prussia the devastation wrought by the Russians, some through wanton lust for destruction and in unreasoning hate for the enemy, but mostly through the pressure of military necessity, was terrible, especially east of the Mazurian Lakes and south of the Niemen. But there, at least, the poor inhabitants had the consolation of being able to return to their destroyed homes after the Russians had been finally driven out and to begin to build up again what war had destroyed, and in this they had the help and support of their highly organized government and their more fortunate compatriots from the interior.

In Poland, however, especially in the rural districts, even that consolation was lacking. For after German and Russian armies

alike had passed over the country again and again, not only destroying values that it had taken centuries to build up, but on account of the huge masses concerned frequently denuding the entire countryside of absolutely every means of sustenance, the final result was occupation by the enemy. And even if that enemy, true to his inherent love of order and to his talent for organization, immediately proceeded to establish a well-regulated temporary government, at the best his efforts would have to be restricted; for he had not much to spare, neither in men to do the work needed, nor in means to finance it, nor even in food to give sustenance to those who had lost everything.

And the worst of it was that for years previous to the outbreak of the war the two principal races inhabiting Poland—the Poles and the Jews—had been fighting each other, with the Russian sympathies strongly on the side of the Poles. Now when war overtook this unfortunate country, both the Poles and the Russians threw themselves like hungry wolves upon the unfortunate Jews. They were driven out from their villages, often the entire population irrespective of age, sex, or condition. They were made to wander from one place to another, like so many herds of cattle, except that no herd of cattle had ever been treated as cruelly as these poor helpless droves of women, children, and old and sick people whose men folk were fighting for their country while this very country did its best to kill their families. This is not the place or time to go into this horrible catastrophe, beyond stating this fact: In July, 1914, Poland had been inhabited by millions of hard-toiling people who, though neither overly blessed with wealth or opportunities, nor enjoying conditions of life that were particularly conducive to happiness, were at least able to found and raise families and to sustain an existence which was bearable chiefly because of the hope for something better to come. Six months later—January, 1915—these millions had stopped toil, for their fields were devastated, their cattle had been killed or driven away, their houses had been burned down. Hundreds of thousands of them had been forced to flee to the interior, other hundreds of thousands had died, some through want and illness, some during the fighting around their homes, some

through murder and worse. Families had been broken up and others wiped out entirely, and thousands of mothers had been separated from their children, perhaps never to see them again. Even if, in isolated cases, destruction, and even death, was merited or made inevitably necessary, in the greatest number of cases the suffering was as undeserved as it was severe.

From a military point of view the net result of the fighting during the first six months of the war most decidedly was in favor of the Germans. February, 1915, found them conquerors along the entire extent of the Russo-German front, and the Russians those who had been conquered. In spite of the wonderful things which German arms had accomplished, however, they had fallen far short of what they had apparently set out to do, and in that wider sense their successes came dangerously near to being failures. But even at that they were still ahead of their adversaries; for though they had not gained the two objects for which they had striven most furiously—the possession of Warsaw and the final destruction of the offensive power of the Russian armies—they held large and very important sections of the Russian Empire, they had driven the enemy completely out of Germany and forced him to do his further fighting on his own ground, and they had reduced the effectiveness of his armies by vast numbers, killing, disabling, or capturing, at a most conservative estimate, at least twice as many men as they themselves had lost.

During the first three weeks of August, 1914, the Russian armies had invaded East Prussia and laid waste a large section of it. Then came the débâcle at Tannenberg, and by the middle of September, Germany was freed of the invader, who had lost tens of thousands in his attempt to force his way into the heart of the German Empire. Not satisfied with these results, the Germans on their part now attempted an invasion of large sections of West Russia, pursuing their defeated foes until they reached the Niemen and its chain of fortresses which they found insurmountable obstacles. It was once more the turn of the Russians, who now not only drove back the invading Germans to the border, but who by the beginning of October, 1914, faced again an invasion of their East Prussian province. However, less than

two weeks sufficed this time to clear German soil once more, and by October 15, 1914, the Russians had again been forced back across the border. By this time the German Commander in Chief, Von Hindenburg, had learned the lesson of the Niemen. Instead of battering in vain against this iron line of natural defenses, he threw the majority of his forces against Poland, and especially against its choicest prize—historic Warsaw. October 11, 1914, may be considered the approximate beginning of the first drive against the Polish capital. During about two weeks of fighting the German armies advanced to the very gates of Warsaw, which then seemed to be theirs for the mere taking. But suddenly the Russian bear recovered his self-control, and with renewed vigor and replenished strength he turned once again against the threatening foe. By October 28, 1914, the Germans in North and Central Poland and the Austro-Hungarians in South Poland had to retreat.

November 7, 1914, became the starting date for the third Russian invasion of East Prussia. The Germans now changed their tactics. Instead of meeting the enemy's challenge and attempting to repeat their previous performances of throwing him back and then invading his territory, they restricted themselves, for the time being, to defensive measures in East Prussia, and launched a powerful drive of their own against Russian territory. For the second time Warsaw was made their goal. By this time, to a certain extent at least, the offensive momentum of both sides had been reduced in speed. Where it had taken days in the earlier campaigns to accomplish a given object, it now took weeks. Of course the rigors of the eastern winter which had set in by then played an important part in this slowing-up process, which, however, effected the speed only of the armies, but not the furor of their battling. December 6, 1914, brought the possession of Lodz to the Germans, and on the next day the Russians were taught the same lesson before the Mazurian Lakes that they had taught to the Germans a few months before when they faced the Niemen. East Prussia up to the Lakes was in the hands of Russia, but beyond that impregnable line of lakes and swamps and rivers they could not go.

In the meanwhile the drive against Warsaw was making small progress in spite of the most furious onslaughts. There, too, a series of rivers and swamps—less formidable, it is true, than in East Prussia, but hardly less effective—stemmed the tide of the invaders. For more than two weeks, beginning about December 20 and lasting well into January, the Russians made a most stubborn stand along the Bzura and Rawka line, and successfully, though with terrible losses, kept the Germans from taking Warsaw. However, in order to accomplish this they had to weaken their line at other points and thus bring about the collapse of their drive against Cracow, by means of which they expected to gain from the south the road into Germany which had been denied to them again and again in the north.

The end of January, 1915, found the Germans practically as far in Poland as the beginning of the month. It is true that they had made little progress in four weeks, but it is also true that they had given up none of the ground they had gained. And with the coming of February, 1915, they reduced their offensive activities at that part of the front and turned their attention once more to East Prussia. The second week of February, 1915, brought to the Russians their second great defeat on the shores of the Mazurian Lakes. By February 15 East Prussia again had been cleared of the enemy, and parts of the Russian provinces between the border and the Niemen were in the hands of the Germans who apparently had made up their minds that they were not going to permit any further Russian invasions of East Prussia if they could help it. They now held a quarter of Poland and a small part of West Russia, while the Russians held nothing except a long battle front, stretching almost from the Baltic to the Carpathian Mountains and threatened everywhere by an enemy who daily seemed to grow stronger rather than weaker.

PART VII—TURKEY AND THE DARDANELLES

CHAPTER LXXXII

FIRST MOVES OF TURKEY

THE entrance of Turkey, the seat of the ancient Ottoman Empire, into the Great War in 1914, with its vast dominions in Europe, Asia, and Africa, created a situation which it was appalling to contemplate. The flames of world war were now creeping not only into the Holy Land, the birthplace of Christian civilization, but to the very gates of Mecca, the "holiest city of Islam." Would the terrible economic struggle in Europe, the war for world trade, now develop into a holy war that would bring the religious faiths of the earth onto a great decisive battle ground?

The seething flames of economic supremacy that were consuming Europe had threatened from the beginning of the war to creep into the Occident, as we shall see in the chapter on "Japan and the Far East." Moreover, as described in "Naval Operations," it was in the waters of the Near East that the first big incident of the war on the sea took place.

Despite the fact that experts had been looking forward to an immediate clash of the dreadnought squadrons of the two countries somewhere between the east coast of Scotland and the Dutch shore, nothing of the kind happened. Instead, both grand fleets ran to safety in the landlocked harbors of their respective countries.

In was to the Mediterranean in the first week of August, 1914, that the attention of the world was first drawn by events. Two German warships, the *Goeben* and the *Breslau*, were off the coast of Algeria. The first was one of the finest ships of the

German navy, a superdreadnought battleship cruiser of 23,000 tons, capable of making more than 28 knots an hour. Her main battery consisted of ten 11-inch guns, and in addition she mounted twelve 5.9-inch guns and twelve 21 pounders. She was capable therefore of meeting on equal terms any enemy vessel in the Mediterranean, and more than capable of outrunning any of the heavier vessels of the French or British navy stationed in those waters. The *Breslau* was capable of a similar speed, but was a much weaker vessel, being a light cruiser of only 4,478 tons. Both of these vessels had enormous coal capacities, the *Breslau*, in particular, being able to travel more than 6,000 miles without refilling her bunkers.

The speed and the coal capacity of these vessels were to prove of vital importance in the events of the next few days. For their rôle was to be one of flight, not to battle. England alone and, in an overwhelming degree, England and France combined hopelessly outnumbered and outgunned the two German warships in the Mediterranean. Realizing this, the German commander, after firing a few shots into the Algerian coast towns of Bora and Philippville, steamed northwest with the intention either of outwitting the English and French squadron commanders, or of running through Gibraltar and so onto the broad Atlantic to wage war upon the British mercantile marine. The British, however, were alive to this danger and headed off the two German warships. Whereupon they turned northeast.

Early on the morning of Wednesday, August 5, 1914, these ships were discovered steaming into the harbor of Messina, Italy. The English and French fleets, close upon the heels of the enemy, immediately took up positions at either end of the Straits of Messina, confident that they had successfully bottled up the Germans.

Then quickly there developed one of the most dramatic incidents in the history of naval warfare. It is described in this chapter as well as in the narrative on "Naval Operations" because of its direct bearing on Turkish politics and policies. The captain and officers of the *Goeben* and the *Breslau* went ashore at Messina, made their wills and deposited their valuables with the

German consul. The decks of the apparently doomed vessels were cleared for action, flags run up to the resounding cheers of the sailors and with the brass bands of the boats playing "Heil dir im Siegerkranz" they steamed swiftly out of Messina harbor to what seemed like certain destruction.

A blood-red sun was quickly setting in the perfect Italian sky. The bands were hushed aboard the German warships, every light was dimmed, and the sailors were ordered to their posts. In tense whispers they discussed the coming fight. The ships were already at top speed ploughing through the waters of the Mediterranean as fast as the throbbing engines could urge them. A sharp look-out was kept for the enemy, but as one hour, two hours, three hours passed and none was seen it became apparent that for the time at least they had evaded detection. Rounding the southern coast of Italy, they turned due east and the course laid for Constantinople.

Morning came and still, at 28 knots an hour, the German warships were speeding toward the Turkish capital—and safety. To the rear, too far to reveal their funnels, the pursuing French and English squadron followed, thin lazy strips of smoke attested their presence to the men aboard the *Breslau* and the *Goeben*.

Suddenly far to the southeast the masts of a single vessel were seen on the horizon. Then the smokestacks of the British light cruiser *Gloucester* poked their tops above the skyline and daringly she opened fire on the mighty *Goeben*. Tempting, however, as the opportunity was for the German commander with an overwhelming force at his heels he dared waste no time nor run the risk of a chance shot disabling his vessel. He sheered off sharply to the northeast and in a few hours lost the plucky *Gloucester* to view.

At the end of this week in August the *Goeben* and the *Breslau*, their engines hot from constant steaming at forced speed, but with flags flying and bands playing, steamed through the narrow channel of the Dardanelles, through the sea of Marmora, and cast anchor off the gloriously beautiful city of Constantinople. As quickly as the formalities would permit the two German warships were transferred to Turkish sovereignty, and to all intents

and purposes, as future events proved, the Ottoman Empire entered the war as an ally of Germany and Austria.

Turkey's attitude in these early days of the crisis of August, 1914, was conditioned by several major causes easily discernible. For almost a generation, Germany has been sedulously cultivating Turkish friendship. With that singled-minded purposefulness so conspicuous in her diplomacy, Germany found it easy, especially under the régime of the former Sultan Abdul Hamid II to outmaneuver the easy-going diplomacy of France, Russia, and England. Indeed, she found a real rival only in England, who, starting with the initial advantage of long political friendship with the Turkish people and the good will that grew out of the Crimean war, successfully opposed many of the chess moves of her German rival.

However, with the coming to Constantinople as German Ambassador of the late Marshal von Bieberstein, German prestige became supreme. Easily the best German diplomatist of the present generation, Von Bieberstein dominated the diplomatic corps at Constantinople and practically dictated the foreign policy of Turkey. Through him, the Deutsche Bank secured the great Bagdad railway concession and completed the commercial subjugation of the country by Berlin.

These disquieting developments had been watched with anxiety in London. But it was not until Von Bieberstein sprang the Bagdad railway surprise that England fully awoke to the situation. Then she stepped in and prevented any extension of the line to the Persian Gulf, an area which British political and commercial circles regarded as peculiarly their own.

At the same time an effort was made to reclaim the position Great Britain had lost in Turkey. With the fall of Abdul Hamid and the coming of the Young Turks there seemed a chance to do this, especially as Germany was looked upon by the members of the Committee of Union and Progress as the chief support of the deposed sultan. Kaiser William, however, played his cards with consummate skill. The German policy was quickly adapted to the new situation. Von Bieberstein was eventually shifted to London and the leaders of the Young Turks, such as the youthful

and popular Enver Bey, were invited to Berlin to come under the influence of the German army chiefs. The British Government, then in the midst of negotiations with Russia and unwilling or unable to enter into any outside arrangement that seemed to oppose the satisfaction of the Russian dream of Constantinople, refused to accept the Young Turks' invitation to guarantee the integrity of the Turkish Empire for a limited period in return for commercial and political concessions. On the other hand, Emperor William reaffirmed to the new sultan his guardianship of Islam and his interest in the welfare of the Mohammedans wherever found.

But perhaps the deciding factor in the inclination of the Turks toward Germany and her ally was to be found in the situation of the Mohammedan world. Turkey had never reconciled itself to the English control of Egypt and India and saw in the present war a possibility such as had never occurred before and possibly would never occur again of wresting from the British the far-flung lands peopled by the followers of Mohammed. With powerful allies, and on more even terms than they had ever dreamed of, they could now do battle with the enemy that held their race in subjugation and with Russia, whose avowed object through generations had been the capture of Constantinople, the possession and perhaps desecration of the holy places of their religion and the dismembering of the last self-governing state of Mohammedism.

These, then, were the major considerations that weighed with the Turkish people, no less than with the Turkish Government, in coming to a decision. So tremendous were the stakes at issue, so widespread, almost world-wide, were the interests involved, that Turkey, situated as it was guarding practically the sole gateway leading from Europe to Russia, could not hope to remain neutral. For better or for worse a decision between the two warring factions must be made.

England, France, and Russia protested vigorously against the action of the Turkish Government in taking over the *Goeben* and the *Breslau*. Turkey replied by drawing attention to an incident that had seriously inflamed public opinion in the Ottoman

Empire. When the war started two first-class battleships, the *Sultan Osman* and the *Reshadie*, were nearing completion for Turkey in English yards. Without any diplomatic preliminaries the British Admiralty confiscated the two ships on the grounds of naval necessity. Whatever may have been the English motive, the Turkish people, regarded this as an attempt on the part of England to weaken the Ottoman Empire and to make it impossible for it to safeguard its national interests in the troublesome days that were surely to come to neutrals as well as to belligerents.

But the Entente Powers hesitated to force a break on the *Goeben* and *Breslau* question and the diplomatic correspondence of the period shows that they had strong hope, not only at that moment, but up to the moment of the final severance of relations of keeping the Turkish nation in a state of neutrality at least. Signs were multiplying, however, that such was not the intention of those in control at Constantinople.

In August and September, 1914, great activity prevailed throughout the country. Arms and ammunition, especially heavy artillery in which the Turkish army was notoriously weak, constantly arrived from Germany and Austria. Every train from the central countries brought German army officers and a sprinkling of German noncommissioned officers with which to stiffen the Ottoman troops. The army was mobilized and General Liman von Sanders, a distinguished German expert, was appointed inspector general of the Turkish army. Immense stores of food and munitions were concentrated at Damascus, Constantinople, Bagdad, and on the Trans-Caucasus frontier, while a holy war against the infidel was openly preached.

German vessels lying off Constantinople seem to have been given more or less of a free hand and frequently searched Russian and British vessels for contraband. The Turkish authorities appear to have gone as far as they dared in preventing Russian supplies getting through to the Black Sea. Russia protested and at times, along the shores of the Black Sea, used methods closely bordering upon open warfare. Both sides, however, seemed reluctant to take definite steps toward an open break.

In so far as Turkey was concerned this was probably due to a disagreement among the members of the Government and others of powerful influence outside official life. It was said that the Sultan, the Grand Vizier and Djavid Bey, Minister of Finance, as well as a majority of the cabinet, were opposed to war. However that may be, the issue was soon decided by a small but immensely powerful clique headed by Enver Bey and Talaat Bey, two of the more prominent and forceful of the Young Turk leaders of the Committee of Union and Progress.

Of all the figures in Turkish life during the first months of the Great War, the most picturesque and probably the most influential in the events that led up to the outbreak of hostilities in Turkey was that of the youthful Enver Pasha. He was one of the heroes of the remarkable rebellion that resulted in the downfall of Abdul Hamid and since then he had ever played a leading part in the constantly shifting drama in Constantinople. Dapper, alert, intelligent, and approachable, modest almost to the point of shyness, Enver was almost a venerated figure among the Turkish people. As he passed on horseback, his slim figure erect and stiff in its military pose, he attracted more attention and interest than did the Sultan himself.

He formed the chief and perhaps the strongest link between Constantinople and Berlin. Honored in an unprecedented manner by the Sultan, Enver's influence in Constantinople was almost supreme. It is through him that the various negotiations with Berlin were conducted. Soon after the triumph of the Young Turk movement Enver went to Berlin as military attaché to the Turkish Embassy, and thoroughly imbibed the Prussian military spirit. He returned to the Turkish capital an enthusiastic admirer of the German army system and became a willing ally of General Liman von Sanders in the latter's attempt to repair the weaknesses of the Turkish army revealed by the Balkan War.

Second only to Enver Pasha in those critical days was Talaat Bey, an old and more experienced member of the inner council of the Committee of Union and Progress and also a prominent figure in the revolution against Abdul Hamid. He was described by Sir Louis Mallet, British Ambassador to Constantinople, as the

most powerful civilian in the Cabinet and also as the most conspicuous of the leaders of the Committee of Union and Progress. He was troubled by no such personal modesty and shyness as was Enver. He was, however, a much harder man to judge. Enver was openly pro-German in the weeks that preceded the actual break with the Entente Powers, but for a long time the real intentions of Talaat Bey were in doubt—at least they were to the British, French, and Russian Ambassadors.

Djemel Pasha, Minister of Marine, while pro-German in his sentiments, is believed to have hesitated in advising an open break, largely because of the condition of the Turkish navy and the state of Turkish finance. The arrival of the *Goeben* and the *Breslau*, the importation of hundreds of German sailors to stiffen the Turkish marine, and, during October, the receipt of about \$20,000,000 in gold from Berlin, won him over. In the end, Djemel Pasha stood with Enver and Talaat.

Other members of the Turkish Cabinet made a demonstration of attempting to hold their country to an uneasy neutrality. Whether their efforts were sincere or designed to prevent an open rupture until the psychological moment had arrived, it is impossible to say. Sir Louis Mallet, in his private dispatches to his Government, expresses his firm conviction that the Sultan, the Heir Apparent, the Grand Vizier, Prince Said Halim, Djavid Bey, the Minister of Finance and a clear majority of the Cabinet were determined not to allow Turkey to be drawn into the war. Up to the very last minute the British Ambassador did not despair of the success of this peace party. Events were too strong for these advocates of neutrality—events and the control of the all-important army and navy by Enver and his associates. By the sword the Ottoman Empire was reared and by the sword it has been ruled ever since.

During the months of September, 1914, and October, 1914, there were many plain signs that Enver Pasha and Talaat Bey were heading straight for a break. On September 9, 1914, the Porte gave notice of the proposed abolition of the capitulations by which the various powers enjoyed extraterritorial rights. At the same time what amounted to a final demand was made upon

the British Government to return the two Turkish battleships seized at the outbreak of the war.

Extraordinary efforts were made by all the Entente Powers to keep Turkey neutral. They proposed to agree to the abolition of the capitulations as soon as a modern judicial system could be set up in Turkey: they agreed to guarantee the independence and integrity of the country for a limited but extended term of years; they declared that Turkey would not suffer by any changes of national frontiers growing out of the war: and England even promised to return the two superdreadnoughts upon the conclusion of the war, claiming that their retention meanwhile was absolutely necessary for her protection.

The main stipulations made by the Entente Powers in return for these concessions were that the German crews of the *Goeben* and the *Breslau* be sent out of Turkey and that General Liman von Sanders and the other members of the German military mission be dismissed. With these demands Turkey refused to comply, after hesitating over the first. Indeed, the strength of the German stiffening in Turkey was constantly becoming greater: by the middle of September there were no less than 4,000 German officers and noncommissioned officers in Constantinople alone and every train from the north brought others. This situation of tension between Turkey and the Entente Powers continued all through September and October. The outside world momentarily expected an open rupture.

CHAPTER LXXXIII

THE FIRST BLOW AGAINST THE ALLIES

ON October 29, 1914, came news of a Bedouin invasion of the Sinai peninsula and an occupation of the important Wells of Magdala on the road to the Suez Canal. England became alarmed, and her composure was not restored by the news that came a few hours later. Claiming that Russia had taken aggres-

sive action in the Black Sea, three Turkish torpedo boats sailed into Odessa Harbor, shelled the town, sank a Russian guardship, and did other considerable damage.

On the following day, October 30, 1914, the Russian Ambassador at Constantinople asked for his passports and the British and French representatives with evident reluctance soon followed suit. On November 1 Turkey were definitely and irretrievably at war with the Entente Powers and an ally of Germany and Austria.

The war from the point of view of the Turkish people was a matter of four frontiers. There was the Dardanelles to guard; there was Egypt and the Suez Canal to be threatened and perhaps captured; there was the Caucasus, where across towering mountains and deep gorges the Ottoman faced the Russian, his hereditary and most feared enemy; and finally there was Mesopotamia. All of these theatres of possible warfare presented military problems, and one of them naval problems among the most intricate and interesting of those facing the nations involved in this unprecedented war. In the Caucasus the mountains and the scarcity of broad passes and good roads, the almost entire lack of railway facilities and the whole nature of the country rendered offensive operations as difficult as on the north-east frontier of Italy or in the Carpathians. In Syria and on the road to the Suez Canal, the waterless desert, the entire absence of railways, the paucity and inadequacy of roads and the nature of the obstacles to be crossed before an invasion of Egypt was possible made the task one of terrible difficulty. In the Dardanelles the peninsula of Gallipoli, strong as it was in natural advantages, was open to naval attack from two and perhaps three sides and its defense must prove not only a costly affair but one the issue of which must be constantly open to doubt. Lastly in Mesopotamia, the task for the Turks was a comparatively easy one, for an invading army must meet with constant difficulties through lack of water, excessive heat, absence of roads and railways and distance from real base of supplies.

At the time of Turkey's entry into the war, military opinion all over the world was divided on the question of the relative

efficiency of her army. All agreed, however, that as an individual fighting animal the Turk had few if any equals. Centuries of warfare had established his reputation, and the wonderful defense of Plevna had set the seal upon it. On the defensive, it was believed by many, he was unbeatable, conditions of supply and equipment being equal.

The Balkan War, however, had been a severe blow to his prestige. It was widely felt that his defeat by the Bulgars, the Serbians, and the Greeks had revealed serious, even vital, weaknesses in the Ottoman army. Consequently the test of Turkey in the Great War was anxiously awaited by both allies and foes. Tremendous issues were at stake, and the failure or success of the soldiers of the Crescent in standing before the troops of Russia, France, and Great Britain was bound to have an important, perhaps decisive, influence on the outcome of the struggle as a whole.

It is doubtful if the general staff of any of the warring countries had any accurate or dependable figures of the Turkish army. Especially was this so of the army on a war footing. At one time only Mohammedans were permitted to serve with the colors, the citizens of other religious beliefs being called upon to pay a yearly tax in lieu of service. Of recent years, however, that law was altered, and in the Balkan War Mohammedan and Christian served side by side and fought with equal ardor for their country. Just how large a proportion of the Christian population had been incorporated into the army at the time of the outbreak of hostilities, few experts were in any position to estimate.

Germany, because of her painstaking investigations in Turkey as well as in every other country, probably was in possession of more accurate data than any other nation, not even excepting the Turks themselves. The best neutral authorities speak of 1,125,000 as the total war-time strength of the Ottoman forces, but that estimate was made prior to the war and before the world had learned that nations under modern conditions are able to place a much larger proportion of their available manhood in the field than was ever thought possible. Probably the Turkish war strength was underestimated. The chief difficulty was not in

finding the men, but in providing quickly equipment, and at the outset that was evidently a very real obstacle in Turkey.

The Turkish army was essentially a German creation, and largely the personal accomplishment of that remarkable military organizer and student of war, Field Marshal von der Goltz. Von der Goltz spent a decade with the Turkish army, and returned to Germany only to reorganize the eastern defenses of his country in preparation for the Great War. When Turkey entered the struggle he returned to Constantinople at Enver Bey's personal request.

The Turk does not become subject to military duty until he reaches the age of twenty. Then, however, for the next two decades he belongs to the army, either actually or potentially. The first nine years are spent in the Nizam or first line, first with the colors and then in immediate reserve. Then come nine years in the Redif or Landwehr, and, finally, two years in the Mustaph'phiz or Landsturm.

All branches of the Turkish army were not equally good. Cavalry and infantry were probably the equal of corresponding troops in the armies of any other country, but the inefficiency of the artillery was blamed for the débâcle of the Balkan War. Many of the thousands of German troops poured into Turkey before and after she entered the war were trained gunners sent with the object of stiffening the weakest arm of the Turkish army.

The Turkish army has always suffered, as have the armies of many other countries, from a shortage of properly trained officers. Since the advent of the Young Turks, and especially since Enver Pasha, with his German training, succeeded to the position of Minister of War and Commander in Chief, the personnel of the officers' corps has been vastly improved. But it takes years—yes, generations—to create an adequate supply of officers and non-commissioned officers for an army of the proportions of Turkey's, and the assistance of the German stiffening must have been of inestimable advantage to the Ottoman command.

At the outbreak of the war the Turkish army was based upon four depots. The number of men actually with the colors, according to the best estimates, was 500,000, with another 250,000 trained

men in immediate reserve awaiting equipment. In or near Constantinople were about 200,000 troops, including the First, Third, and Fifth Corps, a part of the Sixth, and four cavalry brigades. In Thrace, watching the uncertain Bulgars and Greeks, were the Second and most of the Sixth Corps with cavalry regiments and frontier guards. In Palestine, menacing the Suez Canal, were the 40,000 troops of the Eighth Corps, besides unnumbered irregular Arab forces, who could not, however, be depended upon. In the Caucasus the Ninth, Tenth, and Eleventh Corps and three brigades of cavalry were facing the Russian forces across the winding frontier. At Bagdad the Thirteenth Corps, and at Mosul the Twelfth, stood guard over Mesopotamia.

For centuries England had had a very genuine and active interest in the Persian Gulf, recognizing its strategic and potential commercial importance with that foresight which has distinguished her statesmen and traders for generations. Russia had been regarded as the most likely nation to contest England's predominance in that quarter of the world, and her every move was watched and checkmated in Downing Street.

At the outbreak of the war, however, and for a decade before, Germany had given many signs that she had to be reckoned with in any arrangements in the waters washing the shores of Mesopotamia. And it soon became apparent that the domination of that part of Turkey was to be one of the chief spoils of victory. Much has been written about Germany's territorial ambitions. Much of it is based upon pure speculation, but publicists in Germany make no disguise of the Fatherland's desire to win and make a political and economic unit of the countries now embraced in Germany, Austria-Hungary, Servia, perhaps Rumania, Bulgaria, and Turkey in Europe and Asia. One has but to take up the map and outline this aggregation of states and turn to a table of statistics to realize the enormous advantages and powers of such a unit. Politically and economically, it would dominate Europe as has no other power for many generations. Economically and financially, it would be absolutely independent of the rest of the world, but even if it were not, no nation or combination of nations could afford to attempt to isolate it.

CHAPTER LXXXIV

BRITISH CAMPAIGN IN MESOPOTAMIA

IT was some such considerations as these working in the minds of the members of the British Government that impelled them to undertake an offensive in Mesopotamia almost immediately after the break of relations with Turkey. But in addition there were two other reasons. Russia feared a Turkish attack in force in the Caucasus and called to England and France for a diversion. The Mesopotamia campaign working on the right flank of the Turkish forces, as a whole, was an ideal operation intended to draw troops from the Russian frontier. Secondly, the moral effect of any considerable British success in Mesopotamia, and especially the capture of Bagdad, was bound to be very great. Bulgaria, Greece, and Rumania were believed to be waiting for a cue to enter the struggle, and perhaps turn the scales in the Balkans, while the attitude of the Mohammedans in the French and British possessions was largely dependent upon the prestige of those two countries.

Finally, in considering the relative importance of particular campaigns, observers are likely to lose sight of the tremendous importance of possession. In law possession is said to constitute nine points. In warfare, and in diplomacy, which must eventually follow, possession is even more important. When the plenipotentiaries of the warring nations gather around the peace table to arrive at a basis of settlement and the cards are laid on the table, that nation in possession of disputed territory, whatever may be her military and financial condition, is in a position to largely influence the terms. Only by the concession of equivalent advantages or considerations will it be possible to oust her.

How widely this is recognized will be evidenced by the scramble that is made by each of the warring nations to secure possession of the land regarded as its particular sphere of influence. This is true of Mesopotamia, as of many other parts of Europe, Asia, and Africa.

It is evident that the Turkish military authorities were taken somewhat by surprise by the rapidity with which the British Government in India perfected their arrangements for an attack upon Mesopotamia. Knowing that the total British army was extremely limited, it was thought that France, and possibly Egypt, would absorb British military activity for some months to come. There was every reason, however, why the British should not delay the attack upon the shores of Mesopotamia washed by the Persian Gulf. Running down to the left bank of the Shat-el-Arab to a point (Abadam) almost directly opposite the Turkish village of Sanijeh was the enormously important pipe line of the Anglo-Persian Oil Company. Now this pipe line was one of the main supplies of the British navy which, with the launching of the newer superdreadnoughts, was becoming increasingly dependent upon oil instead of coal. So much was this so that the British Admiralty some time before the war bought a controlling interest in this same Anglo-Persian Oil Company. It was, then, primarily to protect this fuel supply from a Turkish raid that an early descent upon the Mesopotamia coast was planned.

On November 7, 1914, the Poona Brigade, composed of white and Indian troops, under command of Brigadier General W. S. Delamain, appeared off the Turkish village of Fao, where an antiquated Turkish fort lies amid a grove of palm trees. Against Persian Gulf pirates it could have put up a valiant fight, but it was a poor match for the guns of the British gunboat *Odin*. The defenders fled and the British force sailed up the Shat-el-Arab. At Sanijeh they effected a landing, intrenched, and awaited the coming of two additional brigades.

It soon became apparent that the Turks, either because they were not prepared or because they preferred to make their real stand nearer their base of supplies, did not intend to offer any serious opposition to the British advance. They adopted tactics designed to harass and delay the invaders, however, and on the 11th of November a small force moved out of Basra and engaged the Indian troops attached to General Delamain's command. After a sharp action the Turks retired. No further opportunity was given them to attack in small force, for two days later Lieu-

tenant General Sir Arthur Barrett arrived at Sanijeh with the Armednagar and the Belgaum Brigades, both made up of Indian troops with a stiffening of British regiments.

By November 16, 1914, the whole of the British forces were ashore, and on the following day at daybreak General Barrett ordered an advance. The main Turkish forces were located at Sahil, about halfway between Sanijeh and Basra. The battle was opened by an artillery duel. The British had a great advantage in the possession of gunboats, upon which had been mounted guns of considerable caliber. The Turks had selected their positions with great skill and knowledge, and despite the heavy artillery preparation, the British troops, when they did advance, were badly punished. Recent rains had made the ground heavy, almost marshy, and the entire absence of vegetation gave the Turkish riflemen and machine-gun crews an excellent chance to work. Slowly the Turks were forced out of their advance positions, but just as the invaders were about to take advantage of the retreat of the enemy a curious phenomenon occurred. Between the advancing British and the retiring Turks a mirage interposed and effectually screened the movements of the latter. Because of this and the heavy ground no pursuit was possible.

This action, resulting in the loss of 353 of the British force and an even larger number of the Turkish troops (estimated by the British at 1,500, but which is almost certainly an exaggeration), decided the fate of Basra. Some opposition was made to the passage of the British river expedition, and at one point an unsuccessful attempt was made to block the passage of the Shat-el-Arab by the sinking of three steamers.

About ten o'clock in the morning of November 22, 1914, the British river force, after silencing a battery that had been hurriedly erected by the Turks just below the town, reached Basra, and General Barrett hoisted the British flag on the German Consulate, the customhouse having been fired by the retreating Turks. Some time was spent by the invaders at Basra in preparing a base.

It was not until December 3, 1914, that Lieutenant Colonel Frazer of General Barrett's force with Indian troops and some

of the Second Norfolks advanced on Kurna, fifty miles above Basra, at a point where the Tigris empties into the old channel of the Euphrates. Lieutenant Colonel Frazer's force was accompanied by three gunboats, an armed yacht, and a couple of armed launches. The troops landed four miles below the town and intrenched, while the river force moved up and shelled Kurna. When the troops advanced, it immediately became apparent that the strength of the Turks had been underestimated and that Lieutenant Colonel Frazer's force was much too small to dislodge them. After losing heavily, Frazer ordered a retreat to the intrenchments four miles down the river, and sent word to Basra for reinforcements.

On December 6, 1914, General Fry appeared with additional troops, and plans were laid for attacking Kurna on the flank. Just as the scheme was nearing completion, however, Turkish officers appeared at the English camp and asked for terms. Conditions were refused, and finally the Turks laid down their arms.

With the capture of Kurna, the British secured control of the Delta of the Euphrates, made impossible any raid upon the Persian Gulf and its oil supply except in great force, and laid the foundations of an ambitious campaign against the strategic points of the whole of Mesopotamia. Elaborate intrenched camps were built at Kurna, and near-by at Mezera, to await the coming of larger forces and supplies.

CHAPTER LXXXV

CAMPAIGN IN THE CAUCASUS

DISQUIETING as was the British offensive in Mesopotamia, the Turkish General Staff were not to be drawn by it from considerations of larger strategy. Acting in agreement with the German and Austrian General Staffs, plans were rapidly pushed for an aggressive offensive in the Caucasus, that old-time battling ground of the Russians and the Turks. Germany was being hotly

pressed in France by the combined armies of Belgium, France, and England, and feared a general offensive on the part of the Russian army.

Turkey's Caucasus campaign in November and December, 1914, was undertaken primarily to relieve the eastern pressure on Germany. In judging it the reader should not lose sight of this larger phase, nor of its relation to the general strategy of the Central Powers.

Across the great isthmus separating the Caspian and Black Seas run the Caucasus Mountains. Parallel to this range of towering mountains, the highest in Europe, runs the frontier line of Russia and Turkey and Russia and Persia, winding in and out among the Trans-Caucasian Mountains. About two hundred miles from the Russo-Turkish frontier stands Tiflis, the rich and ancient capital of Georgia, and one of the prime objectives of any Turkish offensive. One of the few railroads of this wild country runs from Tiflis through the Russian fortress of Kars, forty-five miles from the Turkish frontier, to Sarikamish, thirty miles nearer. On the Turkish side, the fortress of Erzerum stands opposed to Kars, but suffering in comparison by the lack of railroad communication with the interior of Turkey.

Military authorities believed it to be impossible for Turkish troops to take the offensive in the Caucasus in midwinter. Most of the towns stand 5,000 or 6,000 above sea level, and bad roads and snow-choked passes served to make the movement of troops, even in small numbers and unencumbered by supplies and artillery, a task of tremendous difficulty.

Despite all these discouraging circumstances, however, the Turkish General Staff, dominated by the indefatigable and ambitious Enver Pasha, was not to be deterred. A brilliant and daring plan of campaign, aiming at the annihilation or capture of the entire Russian Caucasian army, the seizure of Kars and Tiflis, and the control of the immensely valuable and important Caspian oil fields, was prepared. The unwelcome task of carrying it to completion and success was intrusted to Hassan Izzet Pasha, although Enver Pasha and a staff of German advisers maintained a kind of general control.

The heroic efforts of the Turkish troops, their grim but hopeless battle against equally brave troops, appalling weather conditions, and insuperable obstacles, their failure and defeat when on the very verge of complete success, make an intensely interesting story.

Stationed at Erzerum, Turkey had the Ninth, Tenth, and Eleventh Corps. In addition, the Thirty-seventh Arab division had been brought up from Bagdad to strengthen the Eleventh Corps. At Trebizond two divisions of the First Corps had been brought from Constantinople by sea. These forces totaled about 140,000 troops. At and about Kars, General Woronzov, the Russian commander, had between 100,000 and 110,000 troops at his disposal from first to last. But although weaker in numbers he had the inestimable advantage of operating with a line of railroad at his back, whereas the Turkish commander had to depend entirely upon road transit, 500 miles from the nearest railroad.

The plan of the Turkish command was simple enough on paper. It was a repetition of the tactics attempted by Von Kluck at the battle of Mons and by Von Hindenburg in East Prussia. In fact it was a maneuver constantly repeated by the German commands throughout the war. The Russian main force was to be baited as far as possible beyond the railhead at Sarikamish by a strong demonstration of a part of the Turkish army. The Russians were to be held on this front long enough to permit a double flanking movement, working on the Russian right and aimed at Sarikamish and Kars.

The conditions absolutely necessary for the success of the Turkish plan were the holding of the Russian force beyond Sarikamish, and the accurate timing of the flanking attacks, otherwise the Russian commander would be able to deal with each force separately and defeat and perhaps destroy them.

The campaign opened on November 20, 1914. The Russians, advancing across the frontier from Sarikamish, took Koprikeui, within thirty miles of Erzerum. There, for some time, they remained while the Turkish command prepared for their great coup.

About the middle of December the Eleventh Corps of the

Turkish army moved out of Erzerum, engaged the Russians at Koprikeui, defeated them after a short, sharp struggle, and drove them in disorder a dozen miles to Khorasan. While the Eleventh Corps was thus engaged the Ninth and Tenth Corps, marching forty miles to the north in terrible weather, succeeded in crossing the high mountains that guard the Russian frontier. On Christmas Day they looked down on the town of Sarikamish and the vital railway that stretched away to the eastward. At the same time the two divisions of the First Corps, stationed at Trebizond, making a wider sweep, had, by forced marches through a blinding blizzard that constantly threatened to make necessary the abandonment of the heavy artillery, reached the vicinity of Ardahan.

Reference to a map of the Caucasus will show how advantageously placed the Turkish army was at this time. The Russians had been badly checked at Koprikeui: two army corps were threatening the communications of the advanced Russian troops, and were ideally placed to pierce the Russian line at Sarikamish. At Ardahan a strong force not only prevented a wide turning movement from Kars, but actually threatened to turn the extreme Russian right flank.

At this point, "General Winter," ever an ally of the Russian army, intervened. Operating miles from their base of supplies, finding it impossible to maintain communications between the several corps, the Turkish troops were soon to be in serious difficulties. The long and arduous marches over almost impossible mountains had been too great a strain on even the hardened mountain troops of the Ottoman army. Food was short, and many of the big guns and much of the vital ammunition had been abandoned in the mountain passes. Finally, that necessary condition of synchronization in attack was lacking because of the impossibility of communication between the several Turkish commanders.

The Tenth Corps had reached and was threatening the railway east of Sarikamish on the road to Kars. Its defeat was absolutely necessary to the safety of the Russian army. It was therefore the object of General Woronzov's first attack. During four days

every available man and gun he could bring up on the railway were thrown against the rapidly dwindling ranks of the Tenth Corps. The Turks fought bravely and tenaciously, but weight of numbers and superiority of communications told in the end, and the remnants of the Ottoman forces were driven into the mountains to the north.

The defeat and retreat of the Tenth Corps exposed the left flank of the Ninth, commanded by Iskan Pasha. General Woronzov took full advantage of the situation. Iskan and his 40,000 troops were soon fighting a desperate battle against an enveloping movement that threatened to encompass them on four sides. The cold was intense; hundreds of soldiers in the week of continuous fighting froze to death; dozens were later found standing by their guns, stiff and upright in death. In a score of mountain gullies, 10,000 feet above sea level, thick with a blanket of white snow rapidly becoming crimson with the blood of the dead and wounded, the soldiers of the Crescent fought fanatically to the last.

Of the 40,000 troops of the Ninth Corps, a bare 6,000 struggled out of the mountains to the vicinity of Sarikamish, where they were rallied by Iskan Pasha. For six days and nights this heroic band made a determined attempt to capture the town held by a comparatively weak Russian garrison. Finally, when, surrounded by overwhelming Russian forces, it became apparent that no Turkish relief could reach him, Iskan Pasha and the remnant of his once proud corps surrendered.

The scenes on the battle fields were beyond adequate description. In a great dip between two towering peaks the slaughter of the Turks had been especially great. There no less than 1,500 bodies, piled two and three deep, were counted in one confined area.

Sarikamish was defended against Iskan's 6,000 by a mere handful of soldiers. Time and time again urged by their German officers, the Turks hurled themselves against the thin Russian line. It bent but did not break, as step by step; fighting fiercely all the way, it retreated before weight of numbers. And when relief did come to the defenders, and Iskan and his force were

compelled to surrender, the brave little Russian band was completely exhausted.

In their pursuit of the remnants of the Tenth Corps, the Russians met with some of the difficulties that had been the undoing of the Turks. Furthermore, although the Ninth Corps had been hemmed in so that no relief could reach it, the Turkish command had by no means lost the power of effective counteraction. The Eleventh Corps at Khorosan carried on an energetic campaign against the Russian front, gained a local and tactically important success, and drove the enemy back as far as Kara-Urgan, less than twenty miles from Sarikamish. Indeed, so serious became the threat to the Russian forces that General Woronzov, much against his wishes, was compelled to call off the pursuit of the Tenth Corps and strengthen the Sarikamish front with the troops that had been operating farther to the east.

In the second week of January, 1915, between these forces and the Eleventh Corps of the Turkish army a fierce battle, lasting several days, opened. The struggle was of the utmost intensity, at times developing into a hand-to-hand combat between whole regiments. On January 14 the Fifty-second Turkish Regiment was put to the bayonet by the Russians. At Genikoi a regiment of cossacks charged, during an engagement with a portion of the Thirty-second Turkish Division, and killed and wounded more than 300.

It must be remembered in judging the terrible nature of the struggle that the armies were fighting in difficult country. The battle of Kara-Argan, furthermore, was waged in a continual snowstorm. Thousands of dead and wounded were buried in the rapidly falling snow and no effort was made to recover them. By the end of this week January 16, 1915, owing, largely to their superior railway communications and the possibility of reinforcements, the Russians had not only checked the Turkish offensive but had decisively defeated the Eleventh Corps. Pressing their advantage the Russians pursued the beaten Turks toward Erzerum, but the heavy snows prevented them gaining the full fruits of their victory.

If the Eleventh Corps had not won a victory it had, however,

accomplished its object, in that it had relieved the pressure on the Tenth and enabled it to make good its escape to the north, where it proceeded to effect a junction with the First Corps. The experience of this First Corps had not been a happy one. We left it on Christmas day 1914, overlooking Ardahan. A week later it entered the city and prepared to carry out its rôle in the general offensive by advancing upon the Russian right flank at Kars. It met serious opposition, however, when it attempted to move out of Ardahan, was itself compelled to retreat, and finally sought safety beyond the ridges to the west. There, in the valley of the Chorûk, it joined up with the Tenth Corps. Together they continued their retreat upon Trebizond. Subsequently they tried a new offensive in the Chorûk valley which was undecisive, however, and at the end of January, 1914, the situation had developed into a deadlock.

The Turkish troops in their operation in the Caucasus appeared to have suffered from the difficulty of keeping open their sea communications with Constantinople. Lacking railways they relied too much upon supplies arriving at Trebizond. The Russian fleet in the Black Sea was active, however, and upset the Turkish calculations. In the first week of January, 1915, at Sinope a Russian cruiser discovered the Turkish cruiser *Medjidieh* convoying a transport. After a short engagement the *Medjidieh* was put to flight, and the transport sunk.

On January 6, 1915, the Russian Black Sea fleet ran into the *Breslau* and the *Hamidieh* and damaged them both in a running fight. A week later Russian torpedo boats sank several Turkish supply boats near Sinope.

While this fighting was taking place in the north, farther to the south, toward the Persian frontier the Russians were attempting a turning movement against the Turkish right flank. At the same time that the Russian force in the north crossed the Turkish frontier the Russian column entered Turkey fifty miles farther southeast. On November 8, 1914, this force entered the Turkish town of Kara Kilissa. A week later, making its way southwest for a distance of twenty miles, it engaged,

near the village of Dutukht, a Turkish force composed largely of Arab troops of the Thirteenth Corps. At the outset the Russians met with a measure of success, but on November 22, 1914, the Turks, having been reenforced by troops from Bagdad, began a fierce offensive. After indecisive fighting in the Alash-gird valley the Turks, about the middle of December, 1914, almost caught the Russians in a bold enveloping movement north of Dutukht. In order to escape the Russians were compelled to retreat hurriedly and thus ended their offensive operation in this section.

Still farther to the south, in Persia, the Turks and Russians also battled. Not only because of political conditions, but because of the nature of the country, it was easier for Russia and Turkey to attack each other through Persian than directly across each other frontiers, just as it was easier for Germany and France to reach each other across Belgium. At the outbreak of war both Turkey and Russia, recognizing these circumstances, were occupants of Persian territory. Early in November two Russian columns marched across the northwest corner of Persia and into Turkey by the Kotur and Khanesur passes, evidently with the important city of Van, on the lake of that name as an objective. At a point near Dilman, and again, at Serai, they drove the Turkish troops back toward Van, but were checked by reenforcements.

Meanwhile, the Turks had a more considerable success to the south. Apparently taking the Russian higher command completely by surprise, Turkish troops advanced almost unopposed to Tabriz, the most important of the cities of Northern Persia. Alarmed by this, Russia sent a strong force which, on January 30, 1915, succeeded in recapturing the city.

Thus, up to the end of January, 1915, nothing decisive had been accomplished on the Caucasian front by either Turkey or Russia. The Battle of Sarikamish, resulting in a Turkish loss estimated by the Russian authorities at 50,000, while decisive enough locally, seems to have had no appreciable effect upon the situation as a whole. For reasons resting very largely in the difficulty of finding the troops necessary, as well as in the con-

ditions of the country and the weather, the Russians had been unable to follow up their success. Indeed, the offensive appears to have continued in the hands of the Turks.

It is probably the case that Russia was unwilling to detach any considerable number of troops from her Polish and Galician front, where important events were brewing. Her General Staff rightly regarded the Caucasian front as of secondary importance—and like Austria on her Italian frontier, determined to fight a defensive campaign.

However that may be, conditions, after the first few months of campaigning settled down into a stalemate. Engagements on a relatively small scale were reported from time to time but the balance of advantage remained fairly even. Both countries had fronts where victories would bring larger returns and more immediate effect upon the ultimate outcome of the war.

CHAPTER LXXXVI

TURKISH ADVANCE AGAINST EGYPT

TO the Turk no operation of the war appeared more important than did the campaign against Egypt. That in the early days of the struggle in 1914 he contented himself with what amounted to little more than a demonstration designed to hold as many British troops in Egypt as possible, was due primarily to consideration of larger strategy. Undoubtedly, by his incursion into the Sinai Peninsula and his half-hearted attempt with a hopelessly small force to cross the Suez Canal, he learned many lessons invaluable in any future and more ambitious campaign. Considered as a diversion the early advance upon the Suez was a success: as a serious military operation, resting on its own legs, it was a fiasco.

No operation the Turks might have conducted could have been so unwelcome to the British as was that against Egypt. For weeks in advance it was discussed by English experts and, while

they all, naturally, agreed that it was foredoomed to failure, there was an undercurrent of apprehension in official circles. It was realized that many untried problems and theories would be put to a severe test by such a campaign, if undertaken in a serious way by a large and well equipped force. Of a purely Turkish force, commanded and organized by Turkish officers, there was no fear but such wonderful organizers had the Germans proved themselves to be that the combination of Teuton brains and Turkish fighting qualities and endurance was regarded as formidable.

It was realized in England also, that any measure of success that might come to an invading force would have two very serious results. It would not only threaten, and perhaps sever, the shortest route to the east and so seriously embarrass the trade, military and naval efficiency of the Allies, but it would have a grave and perhaps decisive effect upon Mohammedan malcontents to Egypt and India.

The exact truth of the conditions in India and Egypt will possibly never be known, so rigorous were the operations of the censorship set up by the British War Office. One thing is certain, however, in both countries political conditions were serious before the war and they could not, by any stretch of optimism, be conceived as improving with the coming of a great struggle aimed at the only remaining independent Mohammedan power.

For many months previous to August, 1914, the Indian office in London had been apprehensive of rebellion in India. In Egypt the circumstances that at the beginning of the war the British authorities announced that they would make no use of the native Egyptian army speaks for itself. It was believed in Constantinople and in Berlin that both Egypt and India were ripe for a terrible revolt against the rule of the British Raj; the uprisings of millions of fanatical natives that would forever sweep British control from these two key places to the trade of the world and would institute a Turkish suzerainty, backed and controlled by Berlin. This was thought all the more likely as thousands of the British regular troops had been withdrawn

from India and Egypt for service in France, being replaced by raw levies from England and the Colonies.

These then, were the major considerations that prompted the early offensive against Egypt. It was based upon sound political and military strategy. Just how near it came to complete success, just how much additional worry and effort it added to the burden of Great Britain and France only a complete revelation of the progress of events in all fields will tell.

In the attack upon the canal the Turks operated primarily from their base at Damascus. As preparations progressed the troops that were to take part in the actual advance were concentrated between Jerusalem and Akabah. Under command of Djemel Pasha, Turkish Minister of Marine, there were gathered some 50,000 troops consisting mostly of first line troops of the best character, reenforced by about 10,000 more or less irregular Arab Bedouins.

During November and early December, 1914, the force was moved forward by slow and methodical stages, until by December 15, it was awaiting orders to advance, encamped on the confines of the great desert that separated it from its objective.

Here it is well that the reader should have a good idea of the difficulties of the task the Turkish higher command had imposed upon Djemel Pasha and his troops.

The two chief difficulties to be met by the invaders of the Sinai were lack of transport facilities and lack of water. Three routes were possible for the Turkish army, all artificial obstacles being for the moment ignored; two by land, across the Sinai desert, and the third by sea, across the Mediterranean. The latter, however, must be ruled out because the seas were controlled by the Anglo-French fleet. For the same reason, the northern land route had many disadvantages, because it could be commanded for a part of its length by warships. However, it is instructive to examine it in detail.

The whole region crossed by the sea road is desert of the most difficult and forbidding character. By this road all the great invasions—the Roman, Egyptian, Assyrian, Greek, and French—have been made. The road enters the desert at El

Arish and from there to El Kantara on the Suez Canal, the probable point of attack of an army moving by this route, is 100 miles. Over this whole distance there are only three places, once an army has left El Arish, where water can be had. The first is a matter of a day's march, at El Maza, thirty miles away; the second is at Bir-El-Abd, another day's march; and the third at Katieh, within striking distance of the canal. Without the construction of a special railway the transport of a force large enough to efficiently control the canal by this route seems to be out of the question.

The southern route, known as the Hadj, or Pilgrim's Road, running from Akaba to Suez, besides being longer is even worse off in the matter of water. This was the traditional path of pilgrims traveling from Egypt to Mecca, and still is much in use for that purpose.

Something like 150 miles separate Akaba and Suez, yet only two watering places are to be found in the whole distance. The first is three days' march from the former place, at a point called Nakhl, where modern cisterns had been built and an adequate supply of water for a large force probably was obtainable. The next watering place is another three days' march, at Ayun Monsa, or Well of Moses, within a short distance of the canal.

But tremendous as were the problems facing a considerable body of men in attempting to cross the Sinai desert and arrive at the Suez Canal in condition to fight a strong, fresh and fully prepared foe, they were not to be compared to the difficulties that would face such an army when the canal had been reached. We have seen how great an obstacle a wide river, such as the Vistula proved to be to an army when attempting to cross in the face of a prepared enemy. In the case of the Suez Canal, although there were no strong currents, a force attempting to cross it had to contend with two added difficulties: The Suez Canal could not, in the circumstances be turned, as was the Vistula by the Germans. Furthermore its defensive value was immeasurably increased by the circumstance that it could and did carry warships of the longest type which not only had the value of fortresses mounting the heaviest of guns, but were mobile as-

well. And finally, because of the nature of the shores of the canal, it was possible for an attacking force to cross it at but few points.

The question of crossing the canal or dominating it in any sense was for the Turks largely a question of bringing to bear a superior force of artillery—a task that had only to be stated to reveal its difficulties. No force with smaller or fewer guns would hope to cross the Suez in the face of the concentration of artillery and naval gunfire that the British could bring to bear at any threatened point.

The defenders on the western side of the canal had the additional advantage of railway communication running along the entire canal from Suez to Port Said, and connecting with interior bases.

There were five points from which, once having conquered the desert and reached the canal, the invaders could advantageously launch an attack or attacks upon the canal defenses. The first is just south of El-Kantara, where the old sea road crosses the Suez. Just south of Ismailia a group of heights on the east bank provides a second opportunity. The third is found as the point called the Pleatean of Hyena. The fourth is just north of the Bitter Lake, and the fifth is to the south of the same body of water.

Late in December, 1914, Djemel Pasha began active preparations for an advance upon the canal. This campaign the Turks later called a reconnaissance in force and as, of their total strength of 50,000 men, only 12,000 at the outside and possibly less were used, the limited term seems justified. Although the southern route was used by the main force a small force, eluded the watchfulness of the Anglo-French naval patrol operating along the shore commanding the first day's march of the northern, or sea road, and ultimately struck at El Kantara. Furthermore, sometime before one of these two forces—the larger, or southern—reached the vicinity of the canal, it split and conducted an independent attack at Suez.

There had been much speculation among military experts all over the world as to the possibility or probability of the construc-

tion by the Turks of a light railway running a part of the distance across the Sinai Desert and linking up with the line to Mecca. It was realized that such a railway would be an enormous help to Djemel Pasha and his army, especially in the transport of supplies, ammunitions, and artillery. Indeed, it was held that only by the construction of such a railway, extending almost to the canal, could the absolutely essential artillery be brought into action. There was serious doubt of the ability of the Turks to build such a line. The strength of the German "stiffening" in the army based upon Damascus was believed to be slight. Djemel Pasha is said to have seriously opposed any great number of Teuton officers, especially in the higher commands. Thus the assistance the Turks could expect from the Germans in the organization and construction of such a railway would be small. Whether or not the scheme was feasible at that time it is impossible to say. At any rate the Turks, for reasons best known to themselves, did not put it to a test.

The British force in Egypt was well supplied with aeroplanes and kept the Turkish army under constant observation. With the exception of the use of the first section of the road, covering a couple of days of time, there was probably no element of surprise in the Turkish attack upon the canal. Realizing the limited possibilities of attack from the east shore, the British, taking their lesson from experience in France, had constructed an elaborate system of trenches to the east of the canal at the five points where attacks would possess some likelihood of successful conclusion.

It was the end of January, 1915, before the Turkish army, marching in easy stages across the desert reached the vicinity of the canal. Their German mentors had constructed for them elaborate carriages with the wheels of enormous width to carry the artillery and the heavy supplies across the soft sands. Also, in preparation of a crossing of the canal, the Turks brought a supply of ready-assembled pontoon bridges, running on wheels and similar to those used by the German army in Europe, except that they were much lighter.

In the transport of all this material the Turks were dependent

upon camels, suited as are no other animals for work in the desert. In thousands, they had been collected at Hadj, the cooperation of the Arab Bedouins being specially valuable in this work. The consideration of these events in the campaign which begins in February, 1915, will be found in Volume III of this work.

CHAPTER LXXXVII

FAILURE OF "HOLY WAR" PROPAGANDA

ONE of the most interesting of the various phases of the war, so far as the participation of Turkey was concerned, was the religious development. Countless pages of learned speculation had been written for years before the struggle in an attempt to forecast the outcome of exactly the conditions that had arisen. It must be said at once that in the first six months of the war reality failed to live up to prophecy. The cataclysm that was expected by many to involve the revolt of millions and a vast change in the political color of much of the earth's surface, did not appear. Any change that took place operated so quietly and on so comparatively small a scale that it was lost to view beside the greater interest of the struggle on the battle fields of France and Poland.

It is desirable, however, that the situation be examined. Abbas II, Khedive of Egypt had early in the war openly shown his lack of sympathy with the British in Egypt. By his actions he left no doubt regarding his attitude. He not only vehemently expressed his adherence to Constantinople but left Cairo, and journeyed to Turkey, safe from British official pressure or persuasion. Whereupon the British Government called upon him to return, threatened him with deposition, and finally took that extreme step, setting up another in his place on December 18, 1914.

Furthermore, the day before, Great Britain declared Egypt a British protectorate independent of Constantinople. In this action Great Britain relied not upon any legal right to take such action but merely upon the right of actual possession. Since

Great Britain had taken over the government of Egypt in 1883, she had acknowledged the sultan's rights of suzerainty and had countenanced the payment to that ruler of certain considerable yearly sums from the Egyptian exchequer.

Indeed, Great Britain was in Egypt merely by virtue of an international understanding and on a definite agreement to release her control of the country when certain conditions of political and financial stability had been restored. The other nations had, willingly or unwillingly, become resigned to her possession of this strategically important land. Great Britain a decade before the war, at the beginning of that rapprochement with France which led up to the Entente and which had so many fateful consequences for the whole world, sought to legalize her position in Egypt—at least so far as the other great North African power was concerned. A bargain was struck with France by which the English occupation of Egypt for an indefinite period was recognized in exchange for a free hand in Morocco. Great Britain could now urge that the coming of war, and especially the entry of Turkey into the struggle, placed her administration in Egypt in a position impossible to maintain. In theory, she was so long as she acknowledged the suzerainty of the sultan, in the country, merely on that ruler's sufferance. She admitted his ultimate authority and especially the loyalty and duty of the Egyptian army and khedive to him. Strictly she could make no move to prevent an armed occupation of the country by the Sultan's troops nor could she call upon the khedive and his cabinet to repudiate Constantinople's sway. To put an end to this condition of affairs was the most legitimate reason for England's action.

Although the native Egyptian is in religion allied to the Turk, his religious fervor was not great enough to induce him to rise against British control. Among the better educated of the Egyptians and especially among those who had traveled, there was a strong "Nationalist" movement. At times even in the period of peace, this movement had threatened to make matters extremely unpleasant for the British rulers. For some years before the war, German and Turkish agents had been working among these ardent Egyptian patriots, encouraging and ad-

vising them, and when war with Turkey came England was seriously alarmed. Using the country as a central base for her Turkish, Persian, and Balkan operations, Great Britain imported thousands upon thousands of troops into Egypt. Just how many hundreds of thousands of armed men passed in and out of the country from first to last only the records of the British war office would show, but it can be said that England never had a force of less than 90,000 trained men in Egypt at any one time.

Any chance of effective action that the Egyptian nationalists might have had was neutralized by the indifference and lack of interest in the vast body of their countrymen. There were more than 10,000,000 Mohammedans in Egypt but only a small minority of them, under the most promising of circumstances, could have been counted upon to pay the least heed to the call of Constantinople. The Egyptian fellah is anything but a fighter. Lazy, unlearned, unambitious, he is content to accept his daily lot, perhaps conscious that the British rule has brought a certain amount of comparative prosperity even to him.

On the other hand, there were in Egypt something like 600,000 nomads, a very large proportion of whom could be depended upon to follow the lead of Constantinople. The males of these wild tribespeople were remarkable fighters, subject to no control, hating the English sway, and so independent of roads and transport that they could keep busy an even larger force of less mobile troops. Their chief weakness was their lack of cohesion and the impossibility of any concerted action on their part.

This then was the native situation in Egypt. In other parts of the world, where Great Britain maintained sway over large numbers of Mohammedans, the situation was equally complicated. With the issue of a call for a Holy War by the Sheik-ul-Islam, the religious ruler of the Mohammedan world, many well-informed observers looked for a large measure of trouble in India. So many were the elements of dissatisfaction, and even open revolt, in India that it was believed the Sheik-ul-Islam's call would be the match applied to the powder magazine.

The attitude of the various Indian potentates was uncertain. Some of them were known to be only outwardly loyal to the Brit-

ish authority. The now famous incident at the visit of King George to India, some years before the war, when one of the richest and most important of the native princes refused to bend the knee, was indicative of very widespread dissatisfaction. Innumerable cases of individual and even concerted violence against British rule immediately preceded the war, and several of these were openly encouraged by native princes.

So far as definite action was concerned, the opening of the war with Turkey and the months that immediately followed falsified all these predictions of disaster to British rule in India. Many of the native princes were effusive in their professions of loyalty to the British Empire, and several offered personal service at the front or financial contributions to the huge cost of the struggle.

Notable, and perhaps decisive, was the open adherence to Britain of the Agar Khan, the immensely powerful ruler of millions of Indian Mohammedans. The Agar Khan had spent many of the years previous to the war in England in daily association with English high society and official circles. At the outbreak of the war with Turkey, in October, 1914, at the request of the British Government, he visited Egypt, and it was largely upon his advice that the former khedive was deposed and the new one elevated to the post. Indeed, at one time there were strong rumors, afterward energetically denied by the British Government, that the Agar Khan had advised a Mohammedan repudiation of the authority of the caliph and the elevation of another to his place under a British guarantee. In support of this plan it was pointed out that Great Britain, judged by the number of adherents under her rule, was the world's greatest Mohammedan power. It was intolerable to many English people, especially to those of strong imperialistic tendencies, that the real control, even in theory, of so large and important a section of the people of the British Empire should be in Constantinople, safe from the "influence" and "persuasion" of the British Government. By these people it was held that the sultan's lineal claim was weak, and that an even better claim to the headship of the Moslems could be established for any one of several other men who might have been named. However, the plan was never achieved.

CHAPTER LXXXVIII

RESULTS OF FIRST SIX MONTHS OF
TURKISH CAMPAIGN

WHAT was the situation as a whole, so far as Turkey and her military actions against the Allies were concerned, as to the outcome of these various operations in three fields—the Caucasus, Mesopotamia, and Egypt—during the first six months of the war? The military narrative is recorded in the chapter following. It will be seen that all of them were inconclusive. Indeed, from what we knew of the circumstances surrounding them, all we are justified in saying is that none of them was serious in the sense that they were not intended to have any decisive effect, directly, upon the progress of the war. Of them all, it might be urged by a military authority that they were subsidiary operations, dangerous and wasteful in that they withdrew valuable men, munitions, brains, and energy from the decisive fronts. Their only justification is that they imposed similar action on the part of both armies, and so, in just that degree, scattered their forces. For the Turk it can be urged that at least two of the campaigns were forced upon him by his German mentors, while the third was imposed upon him by a British offensive. Furthermore, the Turk was entirely cut off from his Austro-German allies, and there was no possibility of his bringing his weight to bear in one of the main fields. From that point of view it is possible to justify the Turkish offensives as sound strategy.

Aside from a desire to protect the oil supply in Persia, it is hardly as easy to justify the British offensive in Mesopotamia. As events subsequently demonstrated, it was possible for the Turks to throw an overwhelming number of troops into Bagdad and to the south, and, furthermore, they were fighting under vastly more advantageous conditions than were the invaders. Only on the assumption that the Turks were hopelessly demoralized and disorganized, and that as fighting men they would belie

all their past history, was it possible to visualize success for the British operations in Mesopotamia.

Turkey had definitely come to grips with England and with Russia. She had in none of these fields measured swords with France, although she was equally at war with that country. The exact apportionment of the actual work to be done by the individual powers of the Entente seems to have led to considerable disagreement, and resulted at times in serious delay. Such arrangements depend, of course, upon each country's idea of its spheres of influence. Obviously, no country, if it can help it, is going to waste its men or its efforts in a field in which it has only a minor political or commercial interest. So far as France was concerned, the Caucasus, Egypt—aside from the possibility of the closing of the canal—and Mesopotamia were not of enough importance to justify her in participating in the struggle with the Turks even were it physically possible. All these remarks, of course, are subject to modifications imposed by considerations of the larger strategy of the Entente Powers; but for many months of the war the agreement of the Entente Powers in the matter of general strategy was conspicuous by its absence.

With her neighbors in the Balkans, Turkey had maintained remarkably good relations considering the bitterness engendered, not only by centuries of strife, but by the recent events of the two Balkan wars. Bulgaria, smarting under the loss of territory through the attack upon her by Serbia, Greece, and Rumania in the Second Balkan War, was openly conducting friendly negotiations with Turkey for the acquisition of valuable territory—a compact that could mean only one thing. Greece, frightened by the menace of the German power, had resisted up to the moment all the blandishments of the Entente Powers, who urged her to active participation in the struggle. Rumania, largely isolated from the Entente Powers, menaced on the north by Austro-German forces, on the south by a revengeful Bulgaria, borrowed heavily from Britain, the universal money bag, but straddled the fence.

Thus Turkey, which in different circumstances might have been in a precarious military situation, felt reasonably secure, despite

her isolation. In the early part of the war, however, events moved rapidly and not exactly to her liking. For they threatened to sweep the whole Balkans into the whirl of war, and no man could tell exactly how the various petty states, under the stress of sympathy, military and naval considerations and dynastic control, would align themselves. With these events came, too, the first participation of France in the war against Turkey in the campaign in the Dardanelles, now to be described.

CHAPTER LXXXIX

THE DARDANELLES—STRATEGY OF THE CAMPAIGN

THE beginning of the bombardments in the Dardanelles opens a remarkable chapter in military and naval warfare. The desperate campaign to batter down the fortifications which lead to Constantinople and the disastrous attempt to conquer the most strongly barricaded city in the world, probably excited more world-wide interest or put to the test more theories of warfare than did the Dardanelles Campaign undertaken by Great Britain with the assistance of France. It was fiercely attacked by military critics almost from the start. It was, however, a boldly conceived operation, calculated to have a most important effect upon the war as a whole—certainly upon the war in the southeast corner of Europe.

The Dardanelles campaign was largely conceived and controlled by the Rt. Hon. Winston Spencer Churchill, the remarkable and able British Secretary of the Admiralty. He has been widely condemned for his share of the operation, but revelations that have been made would appear to clear him of a great measure of the blame.

What were the considerations that weighed with the British Admiralty in deciding to undertake one of the most difficult operations in the whole world? Primarily it seems to have had

the idea of relieving the pressure on Russia. The Turkish offensive in the Caucasus had come to grief about the end of December but a resumption was momentarily expected and feared. Hindenburg's victory at Tannenberg in East Prussia had been a terrible blow to Russia and she had no troops to spare for defense in the Caucasus.

Furthermore, Constantinople, besides being one of the objectives of the war, was Russia's only warm sea gate into Europe. It must have been apparent to the Russian military authorities that the existing supplies of munition and guns of the czar's army would not suffice to withstand a hard German-Austrian drive. In other words the condition that resulted in the defeat of the Russian army in Galicia and Poland in the summer of 1915 were foreseen. Russia called upon England and France to force the Dardanelles. One can find it easy to condemn the operation but few can be found who will deny that it was a glorious failure. One that added luster to the glory of the British army, navy, and many unmatched pages to the story of their bravery. And no less credit and glory did it bring to the Turkish armies.

In addition to the question of war supplies there were other reasons for opening the Dardanelles as soon as possible. Russia's ability to finance a war of the magnitude of the one there being fought, especially where large foreign purchases were made, depended very largely upon the maintenance of foreign commerce. Russia was buying from all the neutral world as well as from her Entente partners. England, for instance, was not only making for her millions of dollars' worth of war supplies, but she was, for the moment, financing many of Russia's purchases abroad.

In return for all this it was important that Russia should export as freely as possible. Now one of her most valuable commodities and one in high demand not only in England, but in other countries, was wheat. Millions upon millions of bushels of Russian wheat were stored in her great Black Sea ports waiting to be shipped through Constantinople when the Bosphorus and the Dardanelles were commanded by Entente guns and ships. Greece, under the leadership of Premier Venizelos was hesitating on the brink of a plunge into the struggle as an ally of the En-

tente and not only agreed to the use of Greek islands but actually considered a proposal to send a Greek force of not less than 20,000 and possibly as many as 40,000 over to the Dardanelles. Bulgaria was in that state where a striking victory in the Turkish peninsula would have swept her off her feet. Italy was at loggerheads with Austria, her ally, and about to break.

Then from the English point of view there was the possible effect upon the Mohammedan throughout the British Empire. Possibly not for many years, if ever, will the world know the truth of the conditions in India during the war. One thing is certain. In one way and another there was much disaffection, much open rebellion and much fear of an even wider spread of revolt. The need for the maintenance and even strengthening of British prestige must have been constantly before the British ruler and no other campaign could possibly serve this end so efficacious as a successful assault upon Constantinople and the temporal power of the Sultan. It would clinch probably for generations to come Britain's claim to be the great Mohammedan power of the world and would destroy the one condition that for years before and at that time especially had contained the seeds of rebellion against the British yoke.

In beginning the campaign which Great Britain and France carried on in the Dardanelles there reappeared a very old problem of war—the question of Warships versus Forts or land fortifications. It appears to have been the consensus of opinion among all except the more extreme exponents of battleships that land fortifications would possess an undoubted advantage in a contest against purely naval forces.

This it seems had been the opinion of the American naval authorities in the Spanish-American War, when the American commander, Admiral Sampson, was expressly warned not to risk his ships against the shore defenses of Santiago Harbor. It also appears to have been the opinion of many British admirals who have placed their views on record. Indeed, there was in existence the views of several competent naval authorities as to the possibilities of a purely naval attack upon this very system of defenses.

It was not by any means the first time that an attempt had

been made to force the Dardanelles. Many such attempts had proved this narrow neck of water running between high banks to be one of the great natural defensive spots of the world. The realization of that obvious and oft-proved fact had made Constantinople through the ages one of the most fought for and schemed for cities of the whole world.

It is necessary to study these attempts in order to understand clearly the difficulties which faced the British and French Allies in 1914. Of the previous attacks that had been made to force a way through the Dardanelles and so up to the city of Constantinople, that of the famous Admiral Hornby in 1877 was one of the most interesting as well as one of the most instructive. Ordered by the British Government to take his fleet past the forts that lined the approaching banks, he proceeded to carry out his orders, but wrote a warning in which he pointed out that, while it might be possible for his fleet to make its way into the Sea of Marmora, once there it would be helpless if the land defenses were controlled by the enemy. Out of coal, ammunition, and food, the ships would be at the mercy of the Turks. "Although the forts might not prevent a strong fleet passing through the Dardanelles, they certainly," wrote Admiral Hornby, "could sink armed and unarmed transports and supply ships." In view of these considerations, Hornby urged the British Government to provide a land force of sufficient strength to carry and hold the land defenses. His superiors, however, did not agree with him, for they told him to go ahead with a purely naval operation. His ideas were never put to a real test because the Turks offered no resistance to his passage of the straits.

The situation in the Great War of 1914 presented Constantinople as the same perplexing military problem. If we go back another three-quarters of a century to 1807, the experience of Admiral Duckworth throws some light on the subject, although conditions had changed radically. Duckworth, with his sailing ships, ran past the forts in the Dardanelles and anchored in front of Constantinople. It was hoped that a threat of bombardment would bring the Turks to their knees, but the latter refused to be intimidated. In the end, the British admiral ran out of food and

water and was compelled to leave without accomplishing anything.

The student of the War of 1914 also must consider that during the war between Italy and Turkey, the Italian General Staff is known to have worked out an elaborate plan for an attack upon the Dardanelles. However, at the critical moment, the European powers interfered and forced upon Italy an agreement that the war should not be extended to the mainland of Europe. In the Balkan War, the Bulgarians threatened the lines of Bulier, the narrow neck which connects the Gallipoli peninsula to the mainland, but never launched the attack.

When in 1914 the British and French determined to press a purely naval attack upon the Dardanelles, they appear to have been influenced by two major considerations. At the time there was not ready a sufficient number of troops to make a land campaign successful and, at the last moment, King Constantine of Greece repudiated a personal agreement made by Venizelos, the Greek Premier, with the Allies by which Greece was to provide at least 20,000 troops to assist the France-British fleet. Even after the fall of Venizelos it was still determined to push the naval attack because of the second consideration. In the opinion of the British admiralty the full power of modern naval guns of 11- and 12-inch had never been tested and in their opinion they would suffice to reduce the Dardanelles defenses in a comparatively short time. Furthermore, the British authorities appear to have relied largely upon the new 15-inch guns of the *Queen Elizabeth* and her sister vessels, then nearing completion in British yards. So tremendous was the power of these new guns and so great their range that it was believed the *Queen Elizabeth* and her sister ships could stand miles out of range of the heaviest of the Dardanelles guns and quickly smash them to an unrecognizable mass of ruins.

It was evident that the British naval command held these views even in spite of the experience of British warships off the coast of Belgium earlier in the war. For a while in 1914 British monitors and battleships bombarded almost at will the German troops posted along the coast running from the Dutch frontier

line almost to Nieuport. Finally, however, the Germans brought up heavy army and naval guns and, mounting them in concealed spots among the sand dunes, soon drove off the British naval force.

But Turkish guns were not German guns, Turkish gunners were not German gunners, and above all, the munition supply of the Turkish army was not fed by factories able to turn out a quarter of a million shells a day. Some such considerations as these appear to have convinced the British higher command that there was a difference in the two tasks.

The command of the Dardanelles forts at the entrance to Constantinople and the Black Sea is similar, except that it is perhaps more sure as to the command of the entrance to the Baltic by Copenhagen, the Mediterranean by Gibraltar, and, in a lesser degree, of the North Sea by Dover.

The narrow passage of water called the Dardanelles separates the peninsula of Gallipoli and the Asiatic shore of Turkey. It connects the *Ægean* Sea and the Sea of Marmora, which in turn, through the Bosphorus, connects with the Black Sea. Curiously enough this tremendously important waterway, the only warm sea outlet of Russia, had been closed against that country by the action of the very powers now fighting desperately to smash it open. The Black Sea was a Turkish lake in the Seventeenth Century but in the century following the growth of Russia in that part of Europe made the question of the control of the Bosphorus and the Dardanelles one of supreme importance to her. Thus we find, in the so-called "will" of Peter the Great, among other injunctions he lays upon his successors, an admonition never to rest until Constantinople had been wrested from the Turk. But whether this "will" is authentic or not, Russian policy has steadily kept that object in view.

The Crimean War was an attempt by France and England to stem the almost resistless tide of Russian expanse toward the southwest. Russian control of Constantinople was regarded as the chief danger that threatened the western powers and, in 1856, by the Treaty of Paris, not only was the strength of the Russian Black Sea fleet expressly limited, but the Dardanelles were closed

against the passage of Russia's warships into the Mediterranean. France and England revived what they called "an ancient rule of the Ottoman Empire, in virtue of which it has at all times been prohibited for ships of war of foreign powers to enter the Straits of the Dardanelles and of the Bosphorus."

Turkey was of no mind to leave the enforcement of this "ancient rule" to the powers. She began the construction of more elaborate fortifications commanding both the Bosphorus and the Dardanelles. German advice, especially after the Franco-Prussian War, was asked and obtained and Krupp sent some of his gigantic pieces for the defense of the narrow waters. This German cooperation with the Turks in the strengthening of those positions through all the years that have intervened is significant.

CHAPTER XC

FORTIFICATIONS AND STRENGTH— FIRST MOVEMENTS

LET us inspect the fortifications in the Dardanelles at the beginning of the war in 1914. The Dardanelles, from end to end, have a length of forty-seven miles. From the town of Gallipoli to the Ægean, however, the full distance of the narrow section of the waterway, is a matter of thirty-three miles. At one point the passage is less than 1,400 yards wide and at no point is it more than 7,000. Although there is a good depth in much of the channel, shallows are to be met with in most unexpected places. To make navigation even more difficult, there is a swift and powerful surface current running through the Narrows, on some occasions at a speed of eight knots an hour. In addition there is not only a strong undercurrent, but, as well, many cross currents. At certain seasons of the year the wind and weather make navigation of large vessels almost impossible.

Both sides of the Dardanelles offered natural positions of enormous advantage to a defending force. On the Gallipoli side were

a tangled mass of rocks and hills, almost devoid of vegetation except for stubby yellow bushes. In a few of the little valleys, stray clusters of olive trees relieved the monotony of the view. Heights rose upon heights and along the shores of the peninsula nearly perpendicular cliffs made landings almost out of the question.

This whole peninsula was a difficult country to traverse even in times of peace. No maps existed of its intricate paths, there were few roads, and those that did exist were so commanded by heights and concealed positions for guns and infantry that the progress of an attacking force would inevitably be most difficult and costly.

Water was almost nonexistent. Most of the available supply was so protected that an attacking force would in no case be able to use it until its task of subjugation was complete. As such a force advanced inland, these difficulties as well as those of the country would constantly and rapidly increase. From Cape Hellas, at the tip of the peninsula where a sandy beach made a landing possible, if difficult, the ground rapidly rose to a height of 140 feet. Hill country then led to ridges standing 600 feet, while a mile and a half beyond stood 600 feet in the air the commanding peak of Achi Baba, destined to play so large and so tragic a part in the struggle for the peninsula of Gallipoli. At the narrowest part of the Narrows, the real key position to the straits, stood the Kilid Bahr plateau, 700 feet, while to the northwest, almost 300 feet higher, stood the precipitous eminence of Sari Bair, a dense mass of trackless ravines and thickets.

Where the peninsula of Gallipoli joined the mainland is, comparatively speaking, a narrow neck of land. Even this, however, presented tremendous potential difficulties to any force. A hill almost 500 feet in height rose in the center and marshed on either side prevented a turning movement. Furthermore, the difficulties of landing a force in the face of an enemy strongly intrenched on the heights were not lessened by the circumstance that the cliffs rose to a height of 300 feet, almost straight from the water's edge. In short nature seems to have designed the country in every way as a protection against an armed force seeking to

force its way either in or out of the Black Sea. To just what extent these natural advantages had been utilized by the Turks it is impossible to say. It is not likely, however, that they, or their German mentors, had been idle, in view of the importance the Allies were known to attach to the straits.

In September, 1914, and probably for some time before, the Turks were known to be busy strengthening the forts. Subsequent events led to the conclusion that they, or their German advisers, were alive to the lessons of the early days of the war in France and Belgium and had made elaborate arrangements for the placing of heavy guns in concealed positions. In addition they perfected the mobility of even the heaviest of pieces, so that it became impossible for observation from the Franco-British ships or from aeroplanes to locate them with any certitude.

The Turks also seem to have secured a plentiful supply of sea mines, with which the waters approaching the Dardanelles and the actual passage of the straits were strewn along the shores. Toward the Narrows were constructed shore batteries for the launching of torpedoes, as well as for the launching of floating mines. The strong current of the straits could be depended upon to carry these latter engines of destruction among the allied ships of war should they venture within the narrow, confined waters of the Dardanelles.

This was the condition of affairs, then, on November 3, 1914, when a joint Anglo-French squadron sailed in close to the tip of the Gallipoli peninsula and opened a bombardment of the outer defenses of the Dardanelles. For this and subsequent naval operations against the Turkish position, England was able to detach from her main theatre of naval activity—the North Sea—a considerable number of old, but still extremely powerful, battleships and battle cruisers. These boats, with the exception of the *Queen Elizabeth*, which later appeared on the scene, were all built previous to the introduction of the dreadnought and were to a considerable extent made obsolete by that vessel. At any rate, they could not engage the more modern ships of the German navy and could not be attached to the Grand Fleet of England because of

their lack of high speed and the heaviest of guns. For these reasons, although their loss in any engagement against the Turkish defenses would not be relished by the British authorities, still such a disaster would not be decisive in any war. As Winston Churchill subsequently pointed out, many of them would have, in the ordinary course of events, but a few more years of life in the British navy, so rapidly were modern battleships deteriorating under the rapid advance of naval science.

At the entrance to the straits the Turks had erected two major positions and several minor ones. On the Asiatic shore stood the Kum Kale Fort, known as the "New Castle of Asia." There the main battery consisted of four 10.2-inch guns. A short distance down the coast stood Yeni Shehr, where a main battery of two 9.2-inch guns and a short battery of smaller pieces had been erected. On the European side, opposite Kum Kale, stood Seddel-Bahr, with six 10-inch and two 5.9-inch guns. At Cape Hellas, the extreme point of the Gallipoli Peninsula, was the Erteghrul Battery, mounting two 9.2-inch guns and some minor pieces.

Each of the attacking warships fired about a score of shells at these forts and an attempt was made to determine just how much damage had been done. None of the forts were silenced, however, and it was finally decided by the commander of the Anglo-French naval force, Vice Admiral Carden, that conditions were not propitious for pushing home the attack and the vessels retired out to sea, where they maintained a tight blockade of the Dardanelles. Then there followed a long period of naval inactivity, at least so far as the larger vessel were concerned.

About a month later, however, on December 13, 1914, the commander of a British submarine accomplished a feat in the Sea of Marmora that not only aroused his countrymen to enthusiasm but, as well, won for him the coveted Victoria Cross, the first instance of the winning of that decoration by a naval officer since the beginning of the war.

Lieutenant Holbrook was in command of the *B-11*, a 316-ton submarine launched as far back as 1906. It was in no sense to be compared to the giant underwater crafts that were being

launched and used at the outbreak of the war, some of them measuring 800 feet. The *B-11* carried only sixteen men in all—two officers and fourteen men.

Early in the morning of December 13, 1914, she started through the straits. Evidently her commander had knowledge of the disposition of the Turkish mine field, for Lieutenant Holbrook successfully navigated his ship through it, dived under five rows of mines, any one of which would have blown his frail craft into a thousand pieces, and came up under the side of the Turkish battleship *Messudiyeh*. The *Messudiyeh*, in any other navy, would have been retired long before, but Turkey had none two many ships and probably had been saving her to fight against the equally ancient vessels of some other minor power. Launched as far back as 1874, she had been reconstructed and rearmed in 1901. She was lying in the Sea of Marmora, guarding the very mine field under which Holbrook had dived his craft.

Holbrook observed the *Messudiyeh* through the periscope of the *B-11*, maneuvered for position, dived, came up again and launched his torpedo. It struck home and the ancient sides of the *Messudiyeh* gaped wide. Slowly she sank while Holbrook dived to safety. For nine and a half hours the latter felt his way out of the straits and when he returned to the fleet his little vessel and its daring crew received an enthusiastic demonstration from the soldiers of the larger warships. Besides the Victoria Cross, received by Holbrook himself, his second in command, Lieutenant Sydney T. Winn, received the Distinguished Service Order, and each of the fourteen members of the crew received the Distinguished Service Medal.

On the next day, December 14, 1914, the British submarine *B-9* attempted to repeat the feat, but the Turks were prepared. When she came to the surface mines were exploded all around her, and she had all she could do to make good her escape.

On January 15, 1915, not content that the British should have all the danger, or the glory, the French submarine, *Saphir*, entered the straits. Near Nagara Point, she struck the bottom in one of those shallow spots that abound in the Dardanelles, was

compelled to come to the surface in a disabled condition and was quickly shot to pieces by the Turkish shore batteries.

The movement against the forts in the Dardanelles was now begun. The forementioned events were but the preliminaries. To understand them thoroughly it is necessary also to follow the preceding chapters on Naval Operations. The great story of the Dardanelles develops, however, in the narrative in Volume III of this work.

PART VIII—JAPAN AND THE FAR EAST

CHAPTER XCI

WHY JAPAN JOINED THE ALLIES

THE battle lines of the Great War on land and sea were now beginning to encircle the earth. While the gigantic armies on the battle grounds of Europe were engaged in the greatest test of "the survival of the fittest" that the world had ever witnessed, while the sharp encounters on the seas were carrying the war around the globe, the outbreaks in the Far East were bringing the Orient and the Occident—the two competitive systems of civilization—into a strange alignment. The Moslem world was dividing against itself as had the Christian world. The followers of Buddha and the Brahmins were in direct conflict.

It is important, therefore, to consider in this chapter the development of events in the Far East, which have been only outlined in the preceding narratives. Of all the powers that joined the coalition against Germany in August, 1914, none could state a clearer cause of action than Japan. From the first outbreak of hostilities there was never any question of whether the "England of the East" would enter the war, and on which side she would be aligned. Japan decided promptly, and, having decided, acted with characteristic energy.

For a *causus belli* the Japanese statesmen had only to hold up to the eyes of the world the Anglo-Japanese Alliance, which had been signed on August 12, 1905. The object of this agreement was the maintenance of the general peace in eastern Asia and India, the preservation of the common interests of all powers in China, by insuring the independence and integrity of the Chinese

Empire and the principle of equal opportunities for the commerce and industry of all nations in China, the maintenance of the territorial rights of the high contracting parties in the regions of eastern Asia and of India, and the defense of their special interests in the said regions. If these rights and interests were jeopardized, Japan and Great Britain agreed to discuss fully and frankly what measures should be pursued for defense, and to act in common in case of unprovoked attack or aggressive action wherever arising on the part of any other power or powers.

Thus, in those critical days of August, 1914, one of the first acts of the British Government, when war was declared on Germany, and the empire was reaching out for every possible means of defense and aggression, was to ask Japan for assistance under the terms of this alliance. And Japan did not hesitate—she threw herself vigorously into the Great War. The Japanese Emperor in his declaration of war against Germany did not suggest that Japan acted in response to her ally's direct request for assistance, but the Japanese Foreign Minister, Baron Kato, in his speech explaining the situation to the Diet, laid emphasis upon the treaty as the most important factor in the situation.

"German warships and armed vessels," said the foreign minister, "are prowling around the seas of eastern Asia, menacing our commerce and that of our ally, while Kiao-chau was carrying out operations apparently for the purpose of constituting a base for warlike operations in eastern Asia. Grave anxiety was thus felt for the maintenance of peace in the Far East.

"As all are aware," he continued, "the agreement and alliance between Japan and Great Britain has for its object the consolidation and maintenance of general peace in eastern Asia, and the maintenance of the independence and integrity of China, as well as the principle of equal opportunities for commerce and industry for all nations in that country, and the maintenance and defense respectively of territorial rights and special interests of contracting parties in eastern Asia. Therefore, inasmuch as we are asked by our ally for assistance at a time when commerce in eastern Asia, which Japan and Great Britain regard alike as one of their special interests, is subjected to a constant menace,

Japan, who regards that alliance as a guiding principle of her foreign policy, could not but comply to the respect to do her part."

The Japanese statesman offered this explanation to his people: "Germany's possession of a base for powerful activities in one corner of the Far East was not only a serious obstacle to the maintenance of a permanent peace, but also threatened the immediate interests of the Japanese Empire. The Japanese Government, therefore, resolved to comply with the British request, and, if necessary, to open hostilities against Germany."

Baron Kato's speech was delivered after Japan had declared war. The Western world, when it found time to turn its attention from the absorbing drama already being enacted in Belgium to the minor crisis in the Far East, was not left long in doubt regarding the intentions of Great Britain's ally. War was declared on August 24, 1914, nine days after Japan had dispatched to Germany an ultimatum, which Germany scornfully ignored.

The text of the ultimatum was as follows: "We consider it highly important and necessary in the present situation to take measures to remove the causes of all disturbance of peace in the Far East, and to safeguard general interests as contemplated in the agreement of alliance between Japan and Great Britain.

"In order to secure firm and enduring peace in eastern Asia, the establishment of which is the aim of the agreement, the Japanese Government sincerely believes it to be its duty to give advice to the German Government to carry out the following two propositions:

"(1) To withdraw immediately from Japanese and Chinese waters the German warships and armed vessels of all kinds, and to disarm those which cannot be withdrawn.

"(2) To deliver on a date not later than September 15 to the Japanese authorities, without condition or compensation, the entire leased territory of Kiao-chau, with a view to the eventual restoration of the same to China.

"The Japanese Government announces at the same time that in the event of its not receiving by noon on August 23, 1914, an answer from the German Government signifying unconditional acceptance of the above advice offered by the Japanese Govern-

ment, Japan will be compelled to take such action as it may deem necessary to meet the situation."

The intervention of Japan in the war, welcome as it was to Great Britain, created special problems for that empire. The British in China, and the people of Australia, New Zealand, and western North America had long been uneasy regarding the commercial and political policy of Japan. On the Pacific Coast of the United States and Canada a strong anti-Japanese sentiment had developed. British statesmen were apprehensive lest the entry of Japan into the war might be used to alienate American sympathy from the Allies and diminish the zeal of the Canadian and Australasian colonies for the war.

To meet this situation, the British Government issued a formal statement which said: "It is understood that the action of Japan shall not extend to the Pacific Ocean beyond the China Sea, except in so far as it may be necessary to protect Japanese shipping lines in the Pacific, nor beyond Asiatic waters westward of the China Seas, nor to any foreign territory except territory in German occupation on the continent of eastern Asia." This declaration went far toward allaying uneasiness, especially in the United States.

The Japanese people accepted the situation calmly. There were few noisy demonstrations. Germans living in Japan were not molested, notwithstanding the action of Germany, which immediately after the ultimatum was issued arrested every Japanese subject in Germany and seized funds of the Japanese Government deposited in the Deutsche Bank of Berlin. In Tokyo the chief of police told the people that although the two Governments had entered into hostilities, the people individually were not to cultivate hostility. The German Ambassador remained at the Japanese capital until August 30, 1914. A number of Germans who decided to stay in Japan were allowed to continue their regular occupations.

When no answer came from Germany up to the time of the expiration of Japan's ultimatum, the imperial rescript declaring the existence of a state of war was issued next day.

The emperor said: "We hereby declare war against Germany

and we command our army and navy to carry on hostilities against that empire with all their strength, and we also command all our competent authorities to make every effort in pursuance of their respective duties to attain the national aim within the limit of the law of nations.

"Since the outbreak of the present war in Europe, the calamitous effect of which we view with grave concern, we, on our part, have entertained hopes of preserving the peace of the Far East by the maintenance of strict neutrality, but the action of Germany has at length compelled Great Britain, our ally, to open hostilities against that country, and Germany is at Kiao-chau, its leased territory in China, busy with warlike preparations, while her armed vessels, cruising the seas of eastern Asia, are threatening our commerce and that of our ally. The peace of the Far East is thus in jeopardy.

"Accordingly, our Government and that of his Britannic Majesty, after a full and frank communication with each other, agreed to take such measures as may be necessary for the protection of the general interests contemplated in the agreement of alliance, and we on our part, being desirous to attain that object by peaceful means, commanded our Government to offer, with sincerity, an advice to the Imperial German Government. By the last day appointed for the purpose, however, our Government failed to receive an answer accepting their advice.

"It is with profound regret that we, in spite of our ardent devotion to the cause of peace, are thus compelled to declare war, especially at this early period of our reign, and while we are still in mourning for our lamented mother.

"It is our earnest wish that, by the loyalty and valor of our faithful subjects, peace may soon be restored and the glory of the empire enhanced."

CHAPTER XCII

MILITARY AND NAVAL SITUATION
IN THE FAR EAST

WE now pass to the first fighting ground in the Far East. Unlike the campaigns in the west, the war in eastern Asia developed along lines which any observer, possessing the least knowledge of history and international politics and military strategy, could foresee. From both military and commercial standpoints none of Germany's possessions in the Far East could compare in importance with the little tip of the Shantung Peninsula leased for a term of ninety-nine years from China in 1898. This concession, about fifteen miles long and ten miles across, was designated Kiao-chau. In the sixteen years since their tenure began, the Germans had laid out at Tsing-tau, situated at the extreme southern end of the peninsula, a city which was rapidly growing to foremost importance among the ports of the Chinese coast. A large part of the native population was induced to migrate, hills were leveled, roads constructed, trees planted, and waterworks and sewers laid out along the most up-to-date lines.

The Great War found Tsing-tau a modern city, almost European in appearance, with a magnificent harbor, where natural advantages had been enhanced by the construction of immense piers and breakwaters. One line of railway connected the port with Chi-nan, capital of Shantung Province, and Germany held concessions for the construction of two new lines. The census of 1913 showed a total population of 58,000, of which Germans, exclusive of the garrison, numbered 2,500. Non-German Europeans, Americans, and Japanese numbered but 630. The European quarter was distinctly Teutonic.

The attack on Tsing-tau was a foregone conclusion. As a naval base and a seat of menace to the commerce of hostile nations, Tsing-tau occupied an unexcelled situation, almost equi-distant from Nagasaki and Shanghai, in virtually the same latitude as

Tokyo, San Francisco, and Gibraltar. Its defenses were second in strength only to those of Port Arthur and Hongkong.

Kiao-chau was under the administration of the German admiralty. The German fleet seized it in 1897 ostensibly to secure reparation for the murder of two German missionaries in Shantung. The ninety-nine-year lease subsequently arranged gave Germany the right to fortify the new concession, and the thoroughness with which this privilege was exercised was proved by the stout resistance the garrison was able to make against far superior forces of besiegers. The whole concession occupied 117 square miles.

Although Kiao-chau was the Kaiser's only continental colony in Asia the outbreak of the war found Germany in possession of several islands and groups of islands in the Pacific. These included German New Guinea, the Bismark Archipelago, the Caroline, Pelew Marrana, Solomon and Marshall Islands and a portion of the Samoan group. But the strongly fortified port on the Shantung Peninsula was the naval base for the protection of all these ocean possessions; and the Japanese statesmen rightly concluded that with Tsing-tau in their grasp the reduction of the other German colonies would be only a formal task of seizure. Therefore the 27th of August, 1914, four days after the declaration of war, saw a Japanese fleet blockading Tsing-tau and Japanese transports carrying troops for landing expeditions in cooperation with the warships.

Germany began the concentration of all available forces inside the Tsing-tau fortifications on August 8, 1914. But she was able to gather there when the siege began only 5,000 men, a handful compared with the great force Japan could muster for the reduction of the fortress. The garrison of peace times was augmented by reservists, who came from treaty ports along the Chinese coast, from Japan, Siberia, and from every part of the Far East near enough to enable German veterans to reach the city before communication was cut off.

The crew of the Austrian cruiser *Kaiserin Elizabeth*, more than 300 men, who had left Tsing-tau by railroad before Austria decided to join her ally in the Far East as well as in Europe,

hurried back in small groups and in civilian clothes to escape detection. Squads of the Landsturm, the last reserve, middle-aged men who had left their families and their business in all parts of China joined the ranks and went to drilling in preparation for the hard fighting expected as soon as the invading fleet passed the outer defenses of the harbor. Altogether the defenders mustered three artillery and infantry regiments and four troops of cavalry. They had three aeroplanes and a few machine guns and in the harbor were four small gunboats in addition to the *Kaiserin Elizabeth*.

Tsing-tau's principal points of defense were Mount Moltke, Mount Bismark and Mount Iltis. The rugged slopes of these positions commanded the plain. Beyond the plain the important outer line of defense was along the Litsum River, which flows into Kiao-chau Bay and then through the mountains to the sea, a line about eight miles long and about ten miles distant from the city. Preparations to oppose a landing of hostile troops were made at points along the coast of the leased territory for a distance of twenty miles. At the entrance of the bay shore batteries and mines made a bombardment by the Japanese fleet impracticable, except with the support of land forces.

The first line of defense comprised five forts connected by trenches and barbed wire entanglements. The shore defenses consisted of five forts, called respectively: "The Kaiser's," armed with two large guns mounted upon unsheltered platforms and two cannon of medium caliber sheltered; "August Point," a square closed fort with unsheltered gun platforms, and two guns of large medium caliber; "Taisichen," unsheltered with four large cannon; "Kaiser Northeast," unsheltered four cannon; "Yunuisan Point," two cannon of medium caliber. The main line of defense was for both land and sea work; "Fort Moltke" at the base of the German left wing had a shelter trench and guns of medium caliber; "Fort Bismark" had three heavy gun platforms in addition to a platform for rapid fire guns of large caliber. From this the guns could be turned in any direction. "Fort Iltis" mounted four heavy guns of large and medium

caliber besides mitrailleuse of large size. Two heavy guns were mounted in the summit of Mount Iltis.

In command of the German forces was the Governor General of Kiao-chau, Admiral Meyer-Waldeck, a naval officer of experience and reputation. The defenses of both land and sea were under his control.

This entrance of Japan into the war introduced a factor fraught with unknown possibilities. Unlike the other enemies of the Teutonic alliance, Japan had nothing to fear for her home territory or her possessions. Secure from attack, she was able to devote all her energies to the task of driving the Germans out of the Far East. By this accomplishment she not only fulfilled the terms of her alliance with Great Britain, but strengthened her own supremacy in that quarter of the globe.

Tsing-tau, since its occupation by the Germans, had been like a mailed fist brandished in her face. Since Japan's victory over Russia no other European power had occupied a position on the Asiatic coast that offered a threat comparable to this German stronghold. Also, it was only human that the Japanese remembered how Germany compelled them to abandon many of their fruits of victory in their last war with China.

The unknown factor of her participation was just how far Japan would go in aiding her new allies. The military and naval potentialities of the Island Kingdom when the war started were greater than ever before. She was twice as strong as when she went to war with Russia. Her navy was sufficiently formidable to resist, in home waters at least, that of any other power except England. Her army, twice proved during recent years against the soldiers of Russia and China, was steadily increasing its size and equipment. Her predominant position in the Far East was absolutely assured.

The Japanese army, based to a certain extent upon the German model, numbered at the outbreak of the war somewhat over 250,000 men of all ranks. This was its peace strength. Military service was obligatory upon all able-bodied males between the ages of seventeen and forty. This law made available each year 550,000 men, but in practice during times of peace the annual

conscription amounted to only 120,000 men taken by ballot from among the number eligible. The total effective military strength of the Empire was estimated at a million and a half trained soldiers.

The army was divided into nineteen divisions, four independent cavalry brigades, three independent field artillery brigades, six regiments of heavy field artillery and a communication brigade. Each divisional unit consisted of two infantry brigades of twelve battalions each, a cavalry regiment (three squadrons), a field artillery regiment (six batteries of six guns), and a battalion of army service corps. A battalion of mountain guns was attached to certain divisions. Thus the army on a peace footing consisted of seventy-six infantry regiments (228 battalions), twenty-seven regiments of cavalry, 150 field batteries, nine mountain batteries, nineteen battalions of garrison artillery and nineteen battalions of engineers. When the reserves were summoned to the colors the Japanese system provided for an indefinite increase in the number of battalions for each regiment.

The Japanese navy had weathered a storm which at one time threatened to interfere seriously with its steady growth, and the year 1914 found it at a formidable climax of strength and efficiency. The war with Russia had left the nation on the verge of bankruptcy and the annual budgets from 1907 to 1910 contained no appropriations for naval increases. The lull in naval construction, however, was of short duration. The wisest statesmen realized, from the time when Japan first emerged from her Oriental seclusion and eagerly set out to learn the lessons of western civilization, that their country's insular situation made a strong navy the first requisite of national independence. It was the warships of the western world that forced the Japanese to open their door to the foreigner. Fifteen years after the Japanese had seen the foreign men-of-war riding dominant in their harbors, their antiquated collection of war junks had been replaced by an up-to-date navy, manned and officered by sea fighters trained upon the best western models. In 1910 the Japanese began to compare their naval equipment with that

of Germany, and from that time their shipbuilding program was designed to make them secure against the chance of German aggression, ever present since the leasing of Kiao-chau.

At the outbreak of the Great War the Japanese navy had nearly doubled its strength since the close of the war with Russia. It included two battleships of the dreadnought class, the *Kawachi* and the *Settsu*, both over 21,000 tons, with a speed of twenty knots, two dreadnought battle cruisers of 27,500 tons each and a speed of twenty-seven knots, the *Kongo* and the *Hiyei*; two semi-dreadnought battleships, the *Aki* and *Satsuma*, between 19,000 and 20,000 tons each and a speed of twenty and eighteen and a quarter knots, respectively; four first-class battle cruisers with speeds ranging from twenty to twenty-three knots and averaging 14,000 tons; six battleships of slightly heavier displacement and slightly less speed; six first-class coast defense ships, averaging 13,000 tons and seventeen and a half knots; nine first-class cruisers ranging from 7,300 to 9,800 tons and twenty to twenty-one knots; thirteen second-class cruisers, some of which had a speed of twenty-six knots; seven second-class coast defense ships; nine gunboats, two first-class destroyers capable of thirty-five knots an hour; two second-class destroyers with a speed of thirty-three knots; and forty-six other destroyers of varying speeds; thirty-one torpedo boats and thirteen submarines, besides auxiliary craft, hospital ships, dispatch boats, etc.

Although the Japanese air fleet gave a good account of itself during the operations before Tsing-tau it developed no surprises, and accomplished no exploits to confirm rumors prevailing before the war that in Japan naval aviation had reached a special and advanced stage. The Japanese Flying Corps conducted itself upon lines made familiar by the British, German and French aviators in Europe.

CHAPTER XCIII

BEGINNING OF HOSTILITIES—ATTACKS
ON TSING-TAU FORTS

HAVING reviewed the military and naval situation in the Far East at the outbreak of war, we come now to the beginning of actual belligerent operations.

Japan's declaration of war against Germany was dated August 23, 1914. The morning of the preceding day witnessed the departure from Japanese war ports of the greatest fleet of warships and transports the Empire had sent to sea since the Russian War. It comprised the Second Squadron, embracing battleships, cruisers, destroyers and hydro-aeroplanes, a dozen in all. The transports carried land forces numbering 22,980 officers and men and 142 guns to be put ashore as soon as the landing forces had ground for their advantageous location.

The Japanese troops included the Eighteenth Division, under Lieutenant General Mitsuomi Kamio, who was Commander in Chief of the expedition; the Twenty-third Brigade of Infantry (Major General B. Horiuchi); the Twenty-fourth Brigade of Infantry, commanded by Major General Hanzo Yamanashi, Chief of Staff, and other divisional troops. The Twenty-ninth Brigade of Infantry (Major General G. Joholi). Siege Artillery Corps (Major General Y. Watanebe), the Miyama Heavy Artillery Regiment, the Yokosuka Heavy Artillery Regiment, the Shimonosoki Heavy Artillery Battalion, and the Tadanoumi Heavy Artillery Battalion. Detachments of Engineers and Army Service Corps from the Sixth and Twelfth Divisions. Two Railway Battalions. Railway Guard Troops, the Eighth Infantry Regiment. Detachment of the Flying Corps. Marine Artillery Detachment. Being intended for siege work this army carried no cavalry, horse artillery or light field artillery.

In command of the fleet was Vice Admiral Hikonojo Kamimura, whose reputation as one of Japan's war idols was established when his squadron had defeated three Russian war-

ships, the *Rurik*, *Gromoboi* and *Rossia*, off the east coast of Korea. Later his squadron had taken a commanding part in the great battle in the Japan Sea, which put an end to Russia's naval power in the East. Admiral Kamimura was sixty-five years old, and had spent the greater part of his life in naval service. After the final Russian defeat he was rewarded with the title of Baron and invested with the Grand Cordon of the Rising Sun and the first-class of the Golden Kite.

On September 23, 1914, the Japanese were joined by a British force of 1,369 men under command of Lieutenant Colonel Nathaniel Walter Barnardiston, commander of the British forces in North China, including Wei-hai-wei. Although the British did not arrive until a month after the forces sailed from Japan, the distance that separated Laoshan Bay, where the former made their landing on the original leased territory and thus avoided the breach of neutrality against China committed by the Japanese, was so much shorter and the landing place presented so much less difficulty than the Japanese encountered in their preliminary advance, that the British really arrived on the scene of actual operations just as the Japanese were finishing their first engagements in force, on September 28, 1914.

Colonel Barnardiston's command consisted of 910 non-commissioned officers and men of the Second Battalion South Wales Borderers, and 450 non-commissioned officers and men of the Thirty-sixth Sikhs, besides nine staff officers.

The bombardment of the Tsing-tau forts began on August 26, 1914, and on September 1, 1914, the Japanese bluejackets seized several small islands in Kiao-chau Bay, which the Germans were unable to defend except by long range fire from their shore batteries, and by mines with which the harbor had been thickly sown. Mine sweeping therefore occupied the first activities of the fleet. This operation was signalized by one of the many acts of patriotism and bravery that characterized the siege on both sides. One hundred Japanese women who made their living by diving for pearls in these waters offered to enter the water and release the mines from their moorings so that they would be carried away by the tides. Their courageous offer

was declined, not because the Japanese admiral believed it could not be carried out, but because the Japanese law expressly prohibited the employment of women in warlike operations. When one of the small boats that acted as mine sweepers was blown up during the dragging that followed the women renewed their offer, but again it was declined.

The first landing on the Shan-tung Peninsula was made September 2, 1914. Ten thousand troops were put ashore; but it was not until September 25, 1914, that the invaders made their first capture of a German outpost, Weihsien. The check on the Japanese advance, however, was due less to the defenders of Tsing-tau than to the torrential rains, which swelled the streams and for a time effectively barred further movements. The Japanese artillery was compelled to return to Lun-kow, their original base on the mainland.

The Japanese leaders proceeded with deliberation and caution. They had the enemy penned up with no hope of reenforcement, and nothing was to be gained by haste or the unnecessary waste of men and equipment. On September 19, 1914, to facilitate the movement of their troops behind the beleaguered city, they seized the railway connecting Tsing-tau with the Chinese province of Shan-tung, and China, prompted by Berlin, protested against the act as a violation of neutrality. This was the second Chinese protest, the first having been sent to Tokyo after the Japanese made their first landing on Chinese territory at Lung-kow. To the former objection Japan had no answer except to set forth that the landing was a military necessity and made with no intention of permanent occupancy. To the second protest, however, she replied without hesitation that possession of the railway line was justified since it was owned by Germans. The wide area covered by the Japanese investment campaign is shown by the fact that by September 13, 1914, they had established guards at the railway station of Kiao-chau—a town having the same name as the whole German concession—twenty-two miles distant from Tsing-tau.

While the Japanese infantry and engineers waited for the floods the naval airmen were not idle. The first damage inside

the city was inflicted by two seaplanes which dropped bombs upon the railway station and barracks. Although one of the planes was hit several times by the German guns, both made a safe return. This raid was the forerunner of a systematic air campaign, designed as much to strike terror and discouragement into the hearts of the garrison and the civil population as to gain any military end by the actual destruction of defense works. Bombs were dropped also upon ships in the harbor. Occasionally the Japanese flyers scattered circulars calling upon the defenders to surrender and pointing out the uselessness of further resistance.

The first serious losses on either side were naval. On August 28, 1914, two days after the first bombardment a typhoon swept the Japanese fleet, causing havoc among the little destroyers and sending one to the bottom. Five days later another destroyer ran aground in Kiao-chau Bay. A German merchant ship in the harbor was set afire by the Japanese aerial bombs and destroyed. The greatest naval losses suffered during the whole engagement were the destruction of the Austrian cruiser *Kaiserin Elizabeth* and of the Japanese cruiser *Takachiho*. The *Kaiserin Elizabeth* was sunk by the naval bombardment; but the loss of the *Takachiho* was due to the German torpedo boat *S-90*.

It was September 26, 1914, before the floods subsided sufficiently to permit the Japanese to resume their advance. On that day they drove the Germans from the high ground between the rivers Pai-sha and Li-tsun, and next day they pushed forward to a point seven miles northeast of Tsing-tau, between the Li-tsun and the Chang-tsun. The following morning found them established within five miles of the fortress. Their casualties were reported as three killed and twelve wounded.

These two days saw the heaviest fighting thus far during the siege. While the land forces were pushing up to the main German forts the fleet carried on a general bombardment, having by this time moved in close enough to make gun fire effective and having learned the range. The Japanese warships were assisted by the British battleship *Triumph*, which had joined them a short time before with the British destroyer *Usk*. These British

boats remained throughout the investment, the *Triumph* was a favorite mark for the German gunners, but escaped with comparatively slight damage.

By September 30, 1914, the Germans were driven in from their outer fortifications and Tsing-tau itself was completely surrounded. On that day the defenders made a desperate attempt to regain some of their lost positions, but they were repulsed, and the Japanese settled back for a few days to await the bringing up of their heavy siege guns.

It is said that the failure of this assault, in which the Germans apparently concentrated all their resources, convinced General Kamio that the capture of the city would not prove the long, arduous task that had been expected, and he abandoned forthwith his plans for a long, slow siege and made preparations to take the place by assault. At the same time the Japanese commander showed no disposition to sacrifice his men unnecessarily, and while waiting for their big guns the Japanese worked like beavers with pick and shovel protecting their positions and digging saps and zigzag trenches up to the very face of the German defenses. They labored under a storm of shells but so little exposed that losses under the bombardment were small compared with the casualties of the actual assault operations.

For eight days the Germans poured projectiles into the enemy's works; but for the most part their shooting was a waste of ammunition. Just why the defenders of Tsing-tau were so prodigal of ammunition at this time never has been satisfactorily explained. Military correspondents estimated that during one period of twenty-four hours the forts on the three hills containing the main defensive positions fired more than 2,000 shells without inflicting any loss whatever.

But by October 8, 1914, the German fire slackened perceptibly. They had found that they were wasting their resources and that several positions were almost out of ammunition. The warfare of that period is described in a letter written by an officer with the British expeditionary force:

"That night," he said, "we were working in trenches along a river bed at the bottom of the slope, where the others had been

wounded, and *sans doute* most darnation close to the enemy. A beginning had been made on this trench the night before, so there was a little cover. The two redoubts were about 800 yards on our right and left respectively, the enemy's trenches about 350 yards to our front.

"Well, for the first hour after getting down we were left severely alone. Then they started throwing star rockets and sort of Roman candle things which lit up the place like day, and at the same time they peppered us with Maxims, pompoms, and rifle fire from all three places. We had some men hit further back in the communication trench, but funnily enough none in the forward line. . . . We were entertained by a certain amount of shell fire during the rest of the night. Next night we were due to leave for the forward trenches at dusk to carry on, having had our usual entertainment in the afternoon from the Germans, when suddenly they began throwing shrapnel at our trench. For about half an hour it was all over us, and I'm blest if I know why nobody was hit. It was the overhead cover, I fancy, that saved us this time. We came out like a lot of rabbits when it was over and proceeded to get down below.

"The Japanese artillery was supporting us that night, as we were working on the enemy's side of the river, within 200 yards of their advance trenches. Never have I felt a more comforting sensation then when watching those Japanese shells bursting just over our heads, a little in advance, the shrapnel from them going slap into the Germans every time. I must say it was a magnificent sight when the Japanese guns were going, the German rockets, etc., and their machine guns and rifles joining in when they could get their heads up. One had to shout to make oneself heard, and those who saw it from the top of Heinrich Hill in rear said it was very fine."

During the early days of the siege life in the beleaguered city went on about as usual. A large part of the civil population had withdrawn while there was yet time, but enough shops remained open to supply the needs of those who remained. Cafés continued business and meals were served without interruption at the German Club throughout the siege, although toward the end the num-

ber of those who gathered at the club's tables dwindled to a few administrative officers and civilians.

In a proclamation the day before the expiration of the Japanese ultimatum, Governor Meyer-Waldeck had expressed the spirit of the little garrison in the following words:

"Never shall we surrender the smallest bit of ground over which the war flag is flying. From this place, which we with love and success have endeavored during the last seventeen years to shape into a little Germany across the seas, we shall not retreat. If the enemy wants Tsing-tau, he must come and take it."

Few, if any, military men in Tsing-tau doubted the outcome of the siege; but every resource was prepared for a desperate resistance. The city did not lack food; and after the surrender it was found that enough still remained to provision the garrison for more than three months longer. The supply of running water ceased about the middle of October. News from the outside world came in until November 5, and invariably it told of German successes.

"I remember one evening," said the Tsing-tau correspondent of "The Associated Press," and the only foreign press representative in the city during the siege, "the roar of laughter that went up in the German Club when the news was read that England had asked Portugal for assistance. For two or three days it looked, according to the news, that the British Empire was going to pieces. We heard of revolutions in India, riots in Alexandria, mutiny and martial law in South Africa and even disaffection in Sarawak and North Borneo."

When it became clear that the end was drawing near preparations were made that as few war munitions as possible should fall into the hands of the enemy. The warships in the harbor that had escaped the bombardment were blown up. When the big guns in the forts had fired their last shots the gunners under orders, destroyed them. In many cases this was done because without ammunition the guns were useless.

October 31, 1914, the anniversary of the emperor's birthday, was selected by the Japanese and English for their final bombardment. From 142 guns now occupying commanding positions came

a deluge of shells that continued for seven days. The gunners by this time had the exact ranges and wasted no ammunition. The staffs of the two expeditionary forces gathered on Prince Heinrich Hill to watch the final act of the passing of German rule in the Far East. The warships ranged in the harbor joined in, and after an hour or two it became evident that the German defenses would be swept away by mere weight of metal. Under cover of this terrific gunfire the Allies' troops drove their saps and trenches up the very edge of the defense works, where they waited orders to take the place by storm.

The Germans replied bravely. A great cloud of smoke and dust arose over the doomed city visible far out at sea. In the city the noncombatants took refuge in their cellars and helped care for the wounded. Almost every German position, except the bomb-proof casements where the guns stood, was hammered to pieces. The electric power station was destroyed, so that during the last few nights the city was in darkness.

The last handbills dropped into Tsing-tau by the Japanese aviators contained the following appeal: "To the honored officers and men in the fortress: It is against the will of God, as well as the principles of humanity, to destroy and render useless arms, ships of war, and merchantmen, and other works and constructions, not in obedience to the necessity of war, but merely out of spite, lest they fall into the hands of the enemy. Trusting, as we do, that, as you hold dear the honor of civilization, you will not be betrayed into such base conduct, we beg you, however, to announce to us your own view as mentioned above.

(Signed)

"The Besieging Army."

It is needless to say that the enemy's plea was not heeded. By November 6, 1914, only spasmodic fire from widely scattered positions answered the Allies' bombardment. That night the Japanese and English charged across open ground and took the middle fort in the first line of defense with surprising ease, capturing 200 prisoners. The charge was led by General Yoshimi Yamada at the head of companies of infantry and engineers. At one point they surprised a squad of Germans in charge of a searchlight.

To have fired upon them would have betrayed the advance to the defenders of the adjacent fort; so, the story says, the Germans were quietly and quickly dispatched by the engineers with picks and shovels.

CHAPTER XCIV

CAPTURE OF TSING-TAU

TSING-TAU fell early on the morning of the next day, November 7, 1914. Encouraged by the unexpected successes of the night, the Japanese commander gave the order for a final grand assault. Nobody was more surprised than the Japanese themselves. They had expected a last-ditch resistance and feared they would have to sacrifice a thousand men before gaining these positions commanding the city. But the Germans, their ammunition almost gone, stunned by the continuous rain of shells and broken by long fighting, had decided that further resistance was useless.

The Japanese infantry occupied the central positions on the main line of defense soon after midnight. Just before dawn they captured the north battery on Shaotan Hill, then the east battery of Tahtungehin and the Chungchiawa fort on the west. The heaviest loss suffered by any of the Japanese detachments in the final assault fell upon a company that was caught by machine-gun fire in an attack upon Redoubt No. 2. Out of 250 men only 87 escaped. The total Japanese casualties in the final assault were 450 killed and wounded. The British casualties were slight.

Daylight found the Japanese and British in possession of every position commanding the city and nearly 20,000 men were awaiting the signal to charge the last line of defenses when a white flag appeared on the Tsing-tau military observatory. Within the next hour flags of surrender were flying from all the other German forts. So unexpected was the sudden collapse of the defense that at six o'clock, when the Governor sent Major von Kayser, his adjutant, with a white flag to make terms, the signal of sur-

render was not observed and the Japanese, far from suspecting the German officer's purpose, opened fire, killing Von Kayser's trumpeter and shooting his horse under him.

The formal capitulation of Tsing-tau came at 7.50 o'clock on the evening of November 7, 1914, when both sides signed the Japanese terms. The Germans surrendered unconditionally, but were accorded the honors of war. On November 10, at 10 a. m., Governor Meyer-Waldeck formally transferred possession to General Kamio, and Germany's last foothold in Asia passed from her possession.

News of the fall of Tsing-tau, although not unexpected, caused great rejoicing throughout Japan and among her allies, and profoundly stirred the German world.

The German attitude was expressed by an editorial in the Berlin "Lokalanzeiger," which said: "Never shall we forget the bold deed of the yellow robbers, or of England that set them on to do it. We know that we cannot yet settle with Japan for years to come. Perhaps she will rejoice over her cowardly robbery. Here our mills can grind but slowly. Even if the years pass, however, we shall certainly not often speak of it, but as certainly always think of it. And if eventually the time of reckoning arrives, then as unanimously as what is now a cry of pain will a great shout of rejoicing ring through Germany, 'Woe to Nippon!'"

The Japanese and British forces made formal entry into the captured city on November 16. The Germans had done all in their power to destroy supplies, nevertheless the spoils of victory included 100 machine guns, 2,500 rifles, 30 field guns, a small amount of ammunition, about \$6,000 in cash, 15,000 tons of coal, 40 motor cars, and a large quantity of provisions. Prisoners taken numbered 4,043, including the governor general and 201 German officers and 3,841 noncommissioned officers and men.

The casualties on both sides, considering the length of the siege and the intensity of the gunfire in both directions, were remarkably small. The Japanese had 236 killed and 1,282 wounded, the British had 12 killed and 63 wounded, including two officers. The Germans estimated their losses in killed and wounded at about

1,000 men. To the Allies losses must be added 10 killed and 56 wounded, all Japanese, by the explosion of German land mines several days after the surrender.

The Japanese Commander in Chief, General Kamio, was appointed governor of the captured territory, and the Japanese quickly removed the mines that remained on land and in the harbor, and cleared away the remains of the battered fortifications. The German prisoners were transported to concentration camps in Japan. The Japanese, who yield to no nation on earth in their respect for brave fighting men, treated the Germans with utmost consideration and permitted the officers to retain their swords. General Kamio and Lieutenant Colonel Barnardiston, the British commander, returned to Tokyo on December 18, 1914, and received a demonstration of welcome that had not been equaled since the arrival of the victorious Japanese commanders in the war with Russia.

CHAPTER XCV

OTHER OPERATIONS IN THE FAR EAST

ALTHOUGH the fall of Tsing-tau ended the military activity of Japan in the first year of the war, the capture of the German stronghold was not her only contribution to the anti-Teutonic cause. From the very outbreak of hostilities Russia looked to her former enemy in the Far East for arms and ammunition to equip her huge armies. Shipments from Japan over the Trans-Siberian Railroad began in August, 1914. No record of the value of these Japanese-made munitions is obtainable, but it has been said that the needs of the new Russian armies so far exceeded the capacity of Russian arms and munitions factories that without this Japanese aid Russia could not have continued to make war after the first few months. The armies of the czar were particularly fortunate in obtaining from the Japanese heavy guns to compete with the great cannon brought against them by Von Hindenburg. In this connection it was reported at one time

that the Russians had paid the Japanese for these guns by ceding the northern half of the island of Sakhalin in the Pacific.

The report was quickly denied by the foreign offices of both Russia and Japan, and deserves mention in this history only because it brought forth from Japan the following expression of her attitude toward the war: "Whatever assistance Japan may have given, or may propose to give, to Russia is an outcome of the cordial relations existing between Russia and Japan, and especially to the fact that both are fighting a common enemy. Assistance of this sort can never form the basis of political bargaining or territorial acquisition. Such bargaining would not be in conformity with the relations of special amity which have long subsisted between the two empires, and would be entirely foreign to the national spirit of both powers."

The flow of war munitions across Siberia was interrupted during the early part of 1915, when, for a time, it looked as if Japan might become involved in difficulties with China, but resumed again when the Chinese-Japanese difficulties were settled.

Count Okuma, the Japanese premier, was quoted in the newspaper "Kokumin Shimbun" of Tokyo to the following effect: "Count Okuma emphasizes the impracticability and impossibility of dispatching troops to Europe, but points out that the great advance in the capacity of the Japanese to manufacture munitions will prove of great help to the Allies. The premier said Japan plans to send delegates to the peace conference, although it is not expected to extend the sphere of her influence to Europe. 'Japan wants Europe to recognize Japan's supremacy in the Orient,' he said."

The zeal with which Japan followed out this policy was proved by the fact that big guns were stripped from many of her coast fortifications on the northeastern coast and shipped to Vladivostok.

Japan began a clean sweep of German sea power in the Pacific as soon as she had definitely aligned herself with the Entente Allies. Germany's island possessions were occupied without bloodshed, for the German fleet was too much occupied elsewhere to guard the widely scattered colonies. Early in October a

Japanese fleet visited Jaluit, the seat of the German Imperial commissioner in the Marshall group, and the German officials, having no alternative, surrendered without opposition. Japanese marines destroyed "all establishments of a military nature" there and seized all munitions of war. The next day the Japanese took the island of Yap, which contained the local German headquarters for the Caroline group. Within the next fortnight the flag of the Rising Sun had displaced the Imperial Eagle at the German Government stations in the Marshall Islands, in the Marianne (Ladrone) Islands, and the East and West Caroline Archipelago.

In making these seizures Japan took pains to announce that the landings from the fleet were for military purposes and not for permanent occupation. This assurance was specially conveyed to the United States, which, as the owner of Guam and Wake, to the north and east, respectively, of the Marshall group, was naturally suspicious of the Japanese intentions. In fact, the danger of these operations lay not in possible armed resistance by the Germans, but in the possibility of political complications. As a breeding ground of international suspicion the Pacific Archipelago has been the Balkans of the Far East. Besides Germany and Japan, Great Britain, France, Holland, the United States, and Australia had vital interests there, and any one of these powers might have been offended by a single misstep in the Japanese method of procedure. Repeated assurances from Tokyo, however, that occupation was only temporary and for purely military purposes allayed, for the time being at least, international jealousy.

The Japanese Embassy at Washington pointed out that the occupation of these islands was only in line with Japan's previously announced intention to do what was necessary to protect her own shipping and that of her allies from German cruisers.

The status of these captured colonies, however, after they had passed from German to Japanese control differed from that of Tsing-tau. Japan promised that her occupation of the islands was only temporary and that their final disposition would be settled after the war. Before moving upon Tsing-tau she had declared that after the war this concession would be returned to

China. After the fall of Tsing-tau, when the question arose, the Japanese statesmen pointed out that this promise no longer bound them, since Germany had failed to accept the ultimatum. Occupied with graver issues, Japan's allies did not raise a question regarding the disposition of Tsing-tau; but there is little doubt that Japan, in the event of final victory for herself and her allies, will demand that the former German concession become her permanent possession.

Even after Tsing-tau had fallen, and the German possessions in the Pacific Archipelago were in their grasp, the Japanese kept their fleet on a war footing. German cruisers were still at large in the great expanse of the Pacific. The spectacular cruise of the *Emden* emphasized the harm that might be inflicted by a desperate band of German raiders upon merchant ships in the East. One of the least spectacular, but by no means least important, services rendered by the Japanese warships was in helping the cruisers of Great Britain and Australia escort the Australasian expedition that took part in the campaign at the Dardanelles.

PART IX—THE WAR IN AFRICA

CHAPTER XCVI

CAMPAIGN IN TOGOLAND AND THE CAMEROONS

THE first shots of the Great War had hardly detonated across Europe when their echoes were heard in Africa. The war fever began to hover over Germany's colonial possessions in Africa—Togoland, the Cameroons, German Southwest Africa, and, greatest of all, German East Africa. Each of these colonies became in turn the scene of armed invasions and fierce conflicts, as important to the small forces involved as the great campaigns on the continent across the seas.

When Great Britain declared war on Germany on August 4, 1914, and the news flashed across the world to the official representatives of the warring nations in Africa, the British acting governor of the Gold Coast and the French governor of Dahomey planned a concerted campaign by land in cooperation with the warships to be found in African waters.

The first blow was struck on August 8, 1914, in Togoland, a country about the size of Ireland, lying between French Dahomey and the British Gold Coast. It is populated by a million Hausas and about 400 whites. At the beginning of the war the military force of Togoland could not have exceeded 250 whites and 3,000 natives. Hemmed in on three sides by French and British territory, with a coast line easily approached by warships, the colony was not in a position to offer much resistance if attacked.

On August 8, 1914, a British cruiser appeared before Lome, the capital of Togoland, and the town was surrendered without

CAMPAIGN IN TOGOLAND AND CAMEROONS 569

a shot being fired. But before the British force landed, the little German army of about 60 Europeans and 400 natives fell back to Atakpame, 100 miles in the interior.

While this was happening at Lome an expeditionary force composed of the Gold Coast Regiment, with British officers and commanded by Captain F. C. Bryant, R. A., crossed the frontier in motor cars on August 8, or 9, 1914, and a French force entered Togoland from the other side. A few days later the Allies had possession of all the southern part of Togoland, and advanced together toward Atakpame to capture an important German wireless station at Kamina in the same region.

The only real fighting in this campaign took place on August 25, 1914, when Captain Bryant and his forces had crossed the Monu River. The Allies drove the enemy from his intrenchments, seized the wireless station, and occupied Atakpame. Their losses were two officers and 21 men killed and about 50 wounded.

On August 26, 1914, the Germans surrendered unconditionally, and the Allies came into possession of three Maxim guns, 1,000 rifles and 320,000 rounds of ammunition. It was stated at the time that the Germans offered such a feeble resistance because many natives, on whom they had counted, refused to take up arms against the British.

Togoland having fallen to the Allies, it was arranged between the officials of Great Britain and France that the colony should be jointly governed, each to control that part of Togoland nearest her possessions. In a few months' time normal trade was resumed in the Allies' colony, and since private property had been respected during the invasion, there was nothing left to show that the country had recently been the scene of small but decisive conflicts, far-reaching in their effects.

The action in the African war drama now shifts to the Cameroons (German Kamerun Colony), which Germany took possession of in 1884. It has a seacoast of about 200 miles on the Bight of Biafra. To the northeast and south are the British Protectorate of Nigeria and French Equatorial Africa. The country is largely mountainous and is 290,000 square miles in extent. Be-

fore the war there were less than 2,000 whites among a population of 2,500,000 negroes, principally of the Bantu race.

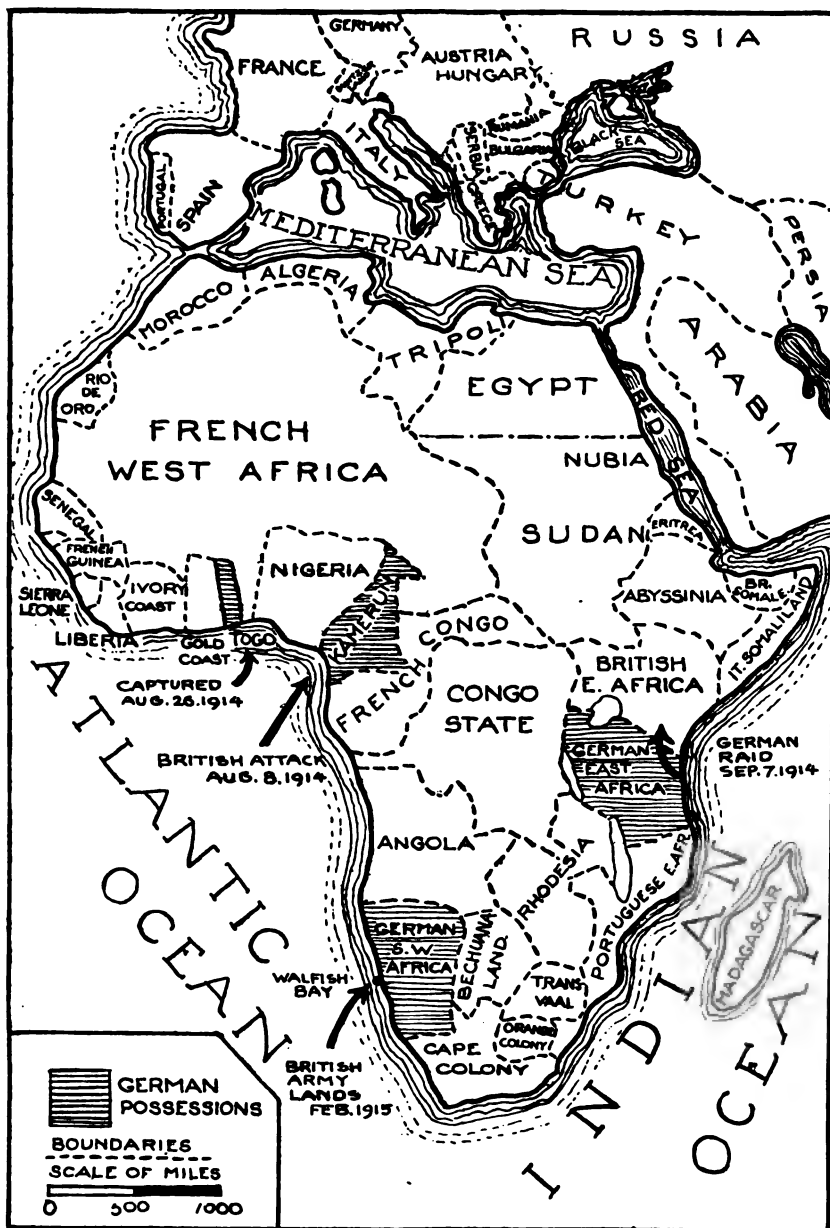

The Cameroons, though surrounded by territory of the Allies, was a more difficult country to conquer than Togoland, owing to its natural advantages and the difficulties of communication over great distances. The first moves of the Allies met with disaster. It was in the African rainy season and misadventures multiplied as the invading troops marched through a wild and badly mapped country. It was decided between the Allies that two French columns should move from French Congo, while British columns entered at different points on the frontier of Nigeria.

On August 8, 1914, a detachment of mounted infantry of the West African Frontier Force left Kano and, marching 400 miles in seventeen days through West Africa, got in touch with the Germans at Tepe, a frontier station just inside the Cameroons. In the fierce engagement that followed the Germans were repulsed, losing five officers and suffering other casualties.

On August 29, 1914, the river station of Garua was attacked, and here one of the most disastrous battles of the campaign was fought. On August 31, 1914, Lieutenant Colonel Maclear, commanding the Royal Dublin Fusiliers and native troops, left their intrenchments 400 yards from the German forts and advanced to attack. The German gunners having perfect range, poured a murderous fire from machine guns on the British forces. The native troops wavered and fled, leaving British officers in the trenches, and these in turn were soon forced to fly to escape complete annihilation. Lieutenant Maclear was killed, and of the 31 other officers only 10 escaped, while 40 per cent of the native troops were lost. The remainder of the British force retreated into Nigeria in such an exhausted condition that had the Germans followed up their victory not a man would have escaped.

The second British expedition which entered the Cameroons from a more westerly point along the Nigerian frontier occupied, after slight resistance, the German station of Nsanakong a few miles from the border, where a week later the Germans attacked in force at two o'clock in the morning. The British resisted stubbornly, but, having exhausted their ammunition, the garrison

CAMPAIGN IN TOGOLAND AND CAMEROONS 571

GERMAN POSSESSIONS IN AFRICA

tried to cut their way out with the bayonet. The British lost three officers, while large numbers of native soldiers were killed or made prisoners. The remainder, escaping to the bush, after many hardships found their way back to Nigeria. Another British expedition from Calabar, near the coast, occupied Archibong, August 29, 1914, while about the same time a German force took possession of the Nigerian station of Okuri.

The British had failed by land; they were more successful on the sea, as will be seen in the chapter on Naval Operations. On September 4, 1914, an attempt was made by the Germans to wreck the British gunboat *Dwarf*, which with the cruiser *Cumberland* was watching German ships in the Cameroon estuary. The German merchantman *Nachtigal* tried later to ram the same gunboat and was wrecked herself with a loss of 36 men. Further attempts to destroy the *Dwarf* also failed.

The British now taking the offensive cleared the channel for three miles, where the Germans had sown mines and sunk 10 or 12 steamboats to obstruct the waterway to Duala, the capital of the Cameroons. H.M.S. *Challenger* and five troopships joined the *Dwarf* and *Cumberland* on September 26, 1914, and, moving on Duala, bombarded the town.

On September 27, 1914, the Germans offered to surrender Duala unconditionally, and on September 28, 1914, Brigadier General C. M. Dobell came ashore and took it over. About the same time a battalion landing at Bonaberi, across the river from Duala, capitulated after some desultory fighting. The wireless station at Duala was found to have been wrecked, but the British took several hundred prisoners, captured 8 merchantmen with valuable cargoes and the German gunboat *Soden*, which was at once put into commission in the British navy. While the British were successful around Duala, a French force by sea from Libreville, French Congo, escorted by their warship *Surpris*, attacked *Ukoko* on Corisco Bay, south of the Cameroons, during which the armed vessels *Khios* and *Itolo* were sunk.

The Allies had captured the chief port and controlled the coast, but the most difficult work lay before them in the mountainous and almost roadless region still to be conquered. The retreating

Germans occupied a defensive position on a river at Japona, where on October 8, 1914, a French column came up with them, forced a bridge, and compelled them to continue their retreat.

On October 8, 1914, Colonel E. H. Gorges, commanding a British naval and military force and four field guns, sailed up the Wuri in launches and found the enemy intrenched near Jabassi. The British made a spirited attack, but were driven back by the accurate fire of the enemy. After a flank attack failed, the order was given to retreat, and the British returned to Duala.

The Allies reenforced, and with two 6-inch guns resumed the attack on October 14, 1914, when the German batteries were soon silenced. After a brisk engagement the infantry occupied Jabassi, taking ten European prisoners. Minor successes won by the Allies at this time were the defeat of the Germans at Susa, and the occupation of the region around Mora, near Lake Chad by a Nigerian Regiment which had entered the colony from the northeast.

Two columns of Anglo-French troops under Brigadier General Dobell, with Colonel Mayer commanding the French colonial infantry, followed the retreating Germans to Edea on the Sanaga River, some fifty miles from Duala. Part of the road led through a thick forest where snipers were concealed, who harassed the expedition at every step and were dislodged with great difficulty.

On October 26, 1914, Edea was taken without resistance, and the enemy retired to Yaunde, a station far in the interior. Mujuka, a station about fifty miles from Duala, was occupied by the British a few weeks later.

Early in November, 1914, General Dobell planned an attack on the German capital of Buea, and its seaport Victoria. The latter place was bombarded by the French cruiser *Bruix* and the yacht *Ivy*; marines were landed, and after a short and spirited fight it was taken, while the enemy, who had concentrated on the hills leading to Buea, were scattered by the Allies' forces advancing from different directions.

The Germans made a determined effort to regain Edea, but were forced to retire with a loss of 20 Europeans and 54 natives. Meanwhile, in the hinterland, the French General, Aymerich,

with a force of men and a steamer loaned by the authorities of the Belgian Congo drove the enemy from the Congo-Ubanghi region, which had been given to Germany in 1911. After two days of strenuous fighting the German posts of Numen and Nola were taken, and some officers, guns, and ammunition.

The greatest campaign in December, 1914, was the capture of the entire northern railway line, with rolling stock, locomotives, two aeroplanes, and about sixty white men. Mendawi, Baré, and Nkongsamba were other posts taken at this period.

At the close of the year the Cameroons were not conquered, but the Germans had been driven into the interior, could not secure supplies, and it was only a question of time when they must surrender or be annihilated. The allied forces were constantly harrying their enemy.

The Allies' next movement was an advance in three columns against Yaunde, where they fought two little battles January 27-28, 1915, and seized the post of Bersona. Near the coast some important operations were successful.

CHAPTER XCVII

GERMAN SOUTHWEST AFRICA—REBELLION IN UNION OF SOUTH AFRICA

GERMAN Southwest Africa, to which we will now turn, was in a different situation at the outbreak of the war from that of the German colonies of the east and west. Over the frontier was a self-governing dominion, the Union of South Africa, with an independent parliament made up of a strange mixture of different parties. The irreconcilables in the Dutch population who had dreamed of a greater Afrikander Republic, would they not take this opportunity to side with Germany who promised to further their ambitions? Great Britain expected some trouble from this element in the Union, and prepared for the worst, while Germany was equally active, and there was much intriguing to persuade

the Dutch to cast in their lot with them. In other parts of Africa, Germany had to fight her battles unaided, but here in the enemy's camp there was every hope of gaining powerful assistance. Until the situation in the Union became clear, it was Germany's part to defend her colony in Southwest Africa, hoping by a brave display of arms to win over the Dutch, who were bitter against England.

German Southwest Africa enjoys many natural advantages. Her capital is far in the interior. Between her railway on the south, which almost reaches the Cape frontier, and her border spreads out the desert of Kalahari and the arid, waterless plains of northwest Cape Colony. The branch railways are separated by about 200 miles from German territory, and on the northern line Kimberley was a little less than 400 miles distant. British forces entering the colony by land must encounter many difficulties, especially in the desert region, which the Germans left undefended because they believed it could not be crossed by troops.

Before the war, according to the official returns, the colony had a force of 3,500 men, mainly whites; but with reserves and volunteers from among the population of German blood it has been variously estimated that an army of from 6,000 to 10,000 men could be gathered together. The Germans were believed to be strong in artillery, and were known to have sixty-six batteries of Maxims. There was also a camel corps 500 strong.

After the declaration of war in August, 1914, Dr. Seitz, the German Governor, began to carry out his plan of defense. In the second week of August, 1914, the Germans abandoned Swakopmund and Lüderitz Bay, their principal stations on the coast, and after destroying the jetty and tugs in harbor, retired with their military stores to Windhoek, the inland capital. In the last weeks in August they made short dashes into British territory, intrenching themselves in some places, and occasionally engaged in a skirmish with farmers on the frontier.

Thus, when the Union Parliament met September 8, 1914, it was informed by General Botha, the Premier, that Germany had begun hostilities against the British colonies. On the following

day, as a challenge to the pro-German party, he moved a resolution to convey to King George an address, assuring him of the loyal support of the Union. Upon this General Hertzog moved an amendment to the effect that attacking German territory in South Africa was against the interests of the Union and the empire. But the victory was with General Botha's Government when the questions were voted on. Only 12 of the 104 votes cast were in favor of Hertzog's amendment.

It was evident that many burghers living in districts on the borders of German Southwest Africa shared Hertzog's opinion, and were opposed to taking offensive measures against the German colony as long as the Union was left in peace. From the time that Hertzog had been dropped from Botha's cabinet he had posed as a martyr. His adherents believed that he had been "sacrificed to please the English," and that Botha was merely a tool in the hands of the British Government.

The spirit of rebellion in the Union did not show itself openly for some time, but the leaders—Beyers, De Wet, Maritz, and Kemp—were busy conspiring and stirring up disaffection among the burghers who had never become reconciled to the Union.

De Wet, because of his world-wide fame during the Boer War, has been given undue prominence for the part he played in the rebellion. He was not the head and front of the movement, though his name was one to conjure with among the disaffected Boers, and he proved to be a valuable recruiting agent. His operations during the rebellion, as will be subsequently shown, were generally ineffective in the field, and terminated ingloriously, before he could work any great harm.

General Beyers, the most dangerous foe the Union had in the rebellion, was a direct contrast to the rude and unlettered De Wet. He was young and brave, and had shown himself one of the ablest soldiers the British had to fight against during the Boer War. He looked the dashing officer that he was—tall, straight, black bearded, and with his pleasant manners and easy speech, he was just the man to inspire enthusiasm in others.

Colonel Maritz and Colonel Kemp, the other chief leaders in the

rebellion, had never been as prominent in South African affairs as Beyers and De Wet. Maritz had shown ability as a leader in the Boer War, had held various military positions since, and at the beginning of the European War was in command of the South African border between the Union and German Southwest Africa, to which he had been appointed by Beyers, who was commandant general of the citizen forces. General Smuts, the Minister of Defense, may have suspected some sinister motives in this appointment, for Maritz had many friends in the German colony, but for the present he had to keep his suspicions to himself and await some overt act of offense.

Colonel Kemp, the remaining chief leader, had never done anything to give him special prominence. He had proved himself an efficient soldier during the Boer War, and appears to have been in command of a training camp in the western Transvaal when the rebellion was started.

Under these four leaders, acting independently, or in conjunction with them, were subleaders, an indefinite number, members of the Government, and men connected with the church and army, whose part in the rebellion was to stir up the people.

An interesting character among the somewhat nebulous subleaders in the rebellion was Van Rensburg, sometimes called "Prophet" Lichtenberg, from the place where he lived. During the Boer War he had predicted a remarkable victory for the Boers, which had resulted in the capture of Lord Methuen, and ever since the burghers of the Union had held him in reverential awe. When the war with Germany broke out he made various prophecies. He discovered that the events foretold in the Book of Revelations would now take place. Germany, he said, had been divinely ordained to conquer the world and purify it. Any attempt to resist this divine ordinance would be punished by the righteous anger of an offended deity. Nor was the "prophet" forgetful of local politics, for he had another "vision" in which he predicted that Generals Delarey, Beyers, and De Wet were divinely appointed leaders, who would restore the old republic. These "prophecies" were spread broadcast throughout the Union, were eagerly believed by the superstitious burghers, and served

to hearten up the disaffected who had some grudge against the Government.

A great meeting of the burghers was summoned to meet August 15, 1914, at Treurfontein. This date had been fixed because Van Rensburg in a "vision" had seen "a dark cloud, with blood flowing from it, inscribed with number 15, and General Delarey, the uncrowned king of western Transvaal, returning home without his hat, followed by a carriage full of flowers." Eight hundred burghers attended the meeting, but Delarey, who spoke, had been warned by General Botha, and therefore spoke calmly, urging the burghers to remain cool and await events. Such was Delarey's influence over the assembly, who had come expecting to make a fiery speech, that a resolution expressing confidence in the Government was passed.

On September 15, 1914, General Christian Beyers resigned his position of commandant general of the defense force in a letter which was practically a declaration of war against the British Empire. It developed that for some weeks he had been organizing rebellion. He was secretly arranging a scheme of operations in which the German forces were to take part, while making plans for the Union Government. He hoped to win over General Delarey, leader of the Boers in the western Transvaal, but this officer was accidentally killed by the police near Johannesburg. The patrol out looking for the notorious Jackson gang of bandits, then in the neighborhood, had orders to examine any motor car and fire at once, if when summoned to stop their challenge was ignored. The car bearing Generals Beyers and Delarey had been twice challenged while passing through the town. The third time a policeman fired at the wheel to disable the car, and the bullet ricocheted and killed Delarey.

A thousand armed Boers at this time were encamped at Potchefstroom in Delarey's district. Colonel Kemp, who had sent in his resignation to the Union Government, and was working here for Delarey, had won over their officers, and on parade urged the men to refuse to volunteer for German Southwest Africa. He also collected in his tent such ammunition as he could lay his hands upon.

The death of General Delarey disconcerted General Beyers, and his fellow conspirators, and Colonel Kemp withdrew his resignation from the Union army. Over the grave of Delarey General Beyers, in the presence of General Botha, declared that he had no intention of advising or causing a rebellion, yet the following day, with General De Wet and others, he was urging the Boers who had come to the funeral of their dead leader to revolt against active service should the commandos be called out under the Defense Act.

Botha knew the men who were stirring up rebellion and acted quickly. He called for volunteers, announcing that he would lead in person the Union forces against the Germans, and the immediate response he received was gratifying. The conspirators remained quiet for some weeks, but General Beyers and De Wet were secretly at work against the Government of the Union.

On September 26, 1914, Colonel Grant and a small force of African Rifles and Transvaal Horse Artillery operating at Sandfontein near the German border were trapped by two German battalions while on their way to a water hole. From the heights the German guns swept the circular basin below where the Union force was gathered. The advantage was all in favor of the Germans. High explosive shells from ten guns wrought havoc among the South African soldiers, but not until their ammunition ran out and every man of their gun crews was either killed or wounded would the little band of Boers and Britons surrender. It developed later that Lieutenant Colonel S. G. Maritz, a Boer leader commanding Union forces in the Northwest territory, had turned traitor and arranged the disaster. It was through General Beyers that he had been appointed to an important command on the German border.

Maritz who was now ordered by General Smuts, Minister of Defense, to report to headquarters and give up his command, sent a defiant reply October 8, 1914. He stated that in addition to his own troops he had German guns and men, and had signed an agreement with the Governor of Southwest Africa ceding Walfish Bay (a British possession) and certain portions of Union territory in return for a guarantee of the independence

of the South African Republic. All his officers and men who were unwilling to join with him had been sent as prisoners into German territory.

General Botha replied to the rebel by proclaiming martial law throughout the Union. General Brits, with the imperial Light Horse, was sent to capture Maritz, and in an engagement October 15, 1914, at Ratedraai, near Upington, took seventy rebel prisoners.

On October 22, 1914, Maritz with 1,000 rebels and seventy German gunners, attacked at dawn the post of Keimos, where there were only 150 loyalists. The little garrison held out until reenforcement arrived and the battle then turned against Maritz, who offered to surrender for a free pardon. This being refused, the fight went on, and Maritz eventually fled wounded into German territory. Two days later a party of rebels with German gunners were defeated at Kakamas.

General Hertzog, who had represented the pro-German party in the Union Parliament, gathered a commando and broke out in revolt on October 21, 1914. He issued a manifesto complaining of English oppression, and announced that he would tolerate it no longer. Three members of the Union Parliament and a member of the Defense Council, Mr. Wessel-Wessels, came out in arms. In the Western Transvaal and the Northern Free State the rebel leaders had about 10,000 men in separate groups. Their plan was to join their commandos with a force under Maritz from German Southwest Africa.

The situation from a military point of view seemed to be serious for the Union, but Generals Botha and Smuts were active and resourceful and in a few weeks had 40,000 men in the field. The loyal Boers were in a difficult position, for now they were asked to fight against their own kith and kin for the British Empire. In battle the Dutch generals showed that they were anxious to spare their own kinsmen, and ordered their men to withhold firing to the last moment, hoping that the rebels would surrender. The rebels were not allowed time to join their forces, for General Botha gave them no rest night or day.

On October 27, 1914, General Beyers and his commando

operating near Rustenburg were driven in headlong flight all day long by General Botha and a force of loyalists. Two days later General Beyers was a fugitive. His scattered commandos were defeated by Colonel Alberts at Lichtenburg and again at Zuitpansdrift on November 5, 1914. Meanwhile, Colonel Kemp, who had been acting with General Beyers, now separated from his chief, and with a large force started for German Southwest Africa, pursued by Colonel Alberts. Beyers, trying to get in touch with De Wet, entered the Orange Free State, closely followed by a large loyalist force under Colonel Lemmer.

On November 7, 1914, Beyers's commando was attacked by Lemmer near the Vet River and though Beyers led in person, he was defeated, and, 364 of his men being captured and about 20 killed or wounded, the fugitive remnant returned to Hoopstad. De Wet, whom General Beyers had been prevented from joining by the activity of the loyalist forces, had gathered together in the northern districts of the Orange Free State a poorly organized body of soldiers, but sufficient in numbers to cause the South African Government some anxiety. Negotiations between the Free State leaders and De Wet postponed for a time any military action by the Government, but the old guerrilla captain was not to be pacified. There had been a rivalry between him and Botha in the Boer war, and he seemed anxious to measure strength now with a soldier whom he considered his inferior.

De Wet's name was a power in the land, especially among the "poor whites" and the squatter class, who without much intelligence or education had not prospered under new conditions in the Union. They were without hope for the future and felt that they were being crowded out by the more active spirits in the country. They saw in the rebellion a chance to improve their economic position. There was little to lose and much might be won. A new Afrikaner Republic would bring back the old days for which they had never ceased to long for. It was from this class of malcontents that De Wet drew the bulk of his men. The rest were religious fanatics, disgruntled politicians, wastrels and adventurers.

We have said previously that De Wet's recruits were poorly organized. It was a weakness of this brilliant guerrilla fighter that he could not maintain discipline when handling a large body of men, and the sort of troops he was working with in the rebellion called for the sternest kind of authority to make them effective soldiers. He only enjoyed a month of freedom and covered considerable territory, but he accomplished very little from a military point of view. He could not follow the same tactics that he had employed in the Boer war with equal success now. At home on the back of a horse, it was impossible for him to slip through the enemy's lines as of old when there were motor cars to pursue. He began his campaign with an action at Winburg where he defeated a small loyalist commando under Cronje, and where one of his sons was killed.

A battle of considerable importance was fought on November 12, 1914, at Marquard to the east of Winburg. General Botha and his Transvaal commando by a forced night march had reached Winburg the day before and getting in touch with De Wet's forces encircled them on the east and northeast. Colonel Brandt at the same time led his commando from Winburg within easy reach of De Wet, while General Lukin, and Colonel Brits moving forward from the west completed the hemming in of the enemy. General Botha's commando attacked De Wet's forces and defeated them with great loss. If General Lukin and Colonel Brits had not been delayed in taking up their positions all the rebels would have been captured. The victory was especially of far-reaching importance because it discouraged De Wet's hopes and strengthened the loyalist cause. All of De Wet's stores of food and ammunition were taken, and a hundred carts, wagons and motor cars, while the prisoners numbered about 250.

De Wet, with a Boer commando in pursuit now fled up the Vet River, then turning south at Boshoff, divided his decreasing force into two divisions. Leading one of these he turned again north, reaching the Vaal River with only 25 men remaining of the 2,000 he had fought with at Marquard.

Beaten back by a loyal outpost he succeeded in crossing the

Vaal on November 21, 1914, closely pursued by Commandant Dutoit and a motor car contingent from Witwatersrand. De Wet's followers had gradually deserted, and he had only four men with him when he succeeded in joining a small commando of fugitives gathered at Schweizer Renek. The heavy rainstorms at this time favored him as he started with this force to follow Colonel Kemp and join Maritz in German Southwest Africa, for the motor cars in pursuit could make small progress over the heavy roads. Crossing Bechuanaland on November 25, 1914, De Wet was pursued by another loyalist force under Colonel Brits who in two days captured half of the fugitives.

On December 1, 1914, at a farm at Waterburg, about a hundred miles from Mafeking, De Wet and his party of 52 men surrendered to Colonel Jordaan without firing a shot, and the one-time Commander in Chief of the Orange Free State forces was imprisoned at Johannesburg to await his trial for high treason.

In the Orange Free State, General Beyers and about seventy men harried by loyal commandos divided his party, and leading one group made a dash for the Vaal River pursued by Captain Uys and Cornet Deneker with a small force. Trapped at day-break on December 9, 1914, near the Vaal, Beyers and a few men tried to swim the river to the Transvaal under a fierce fire. Beyers was seen to fall from his horse, and was heard to cry for help, but was drowned before anyone could come to the rescue.

General Botha's operations in the northern district of the Orange Free State were made difficult because of the heavy fogs, but early in December, 1914, the rebels were in sore straits, 500 being captured while 200 surrendered to Commandant Kloppers a loyalist, who had been taken a prisoner and was afterwards released.

General Maritz, Colonel Kemp, and the "Prophet" Litchtenburg had fled west, and after some fighting at Kurumun, and two minor successes, surprising two posts at Langklip and Onydas which they were forced to abandon on the arrival of reinforcements, they retired toward the German frontier where they were penned in by the Union forces.

On January 24, 1915, the rebels made their last sally, attacking Colonel Van der Venter at Upington. The rebel force, about 1,200 strong and led by Maritz and Kemp, was easily repulsed. On February 3, 1915, Maritz, having fled to German territory, Colonel Kemp and his commando of 43 officers and 486 men including the "Prophet" Lichtenburg surrendered.

CHAPTER XCVIII

END OF THE REBELLION—INVASION OF GERMAN SOUTHWEST AFRICA

WITHIN the first six months of the war the rebellion had been crushed. One reason for its speedy decline and fall was the general amnesty offered to all rebels who surrendered voluntarily by November 21, 1914. But to General Botha and his lieutenant, General Smuts, credit must be given for their masterly operations in the field, and the clear-headed way in which the campaign against the rebels was conducted. In less than two months General Botha had harried them from all points of the compass until they lost their nerve and became at last dispirited and weary. In numbers they were sufficient to prolong the conflict for a much longer period, but the quick moves made by Botha's men made it impossible for them to concentrate at any given point. Separated from each other in isolated bands it was impossible even with the best fighting to gain a notable victory. During the campaign General Botha had taken 7,000 prisoners, while the total casualty list of the Union army was only 334. In the hour of triumph he showed great magnanimity. The rank and file of the rebel army were not punished, but members of the defense force who had violated their military oath were placed on trial for their life.

Now that the rebellion at home had been disposed of, General Botha could turn his attention to his long-projected invasion of German Southwest Africa. As originally planned the expedition

was weak in numbers, inadequately trained, was without aircraft, and lacked sufficient artillery, but all these deficiencies were now made good.

On January 5, 1915, the burgher force reassembled, and began to encamp on Green Point Common on the way to German Southwest Africa. Thousands of Boers, freshly trained for war through their recent operations against the rebels, were with this army of invasion.

German Southwest Africa was in some respects one of the most valuable of Germany's colonial possessions in Africa. It contains 320,000 square miles, which is about the size of Germany and Italy together. It has a seacoast of 800 miles on the west, is bordered on the north by the Portuguese colony of Angola, and on the east by the British Protectorate of Bechuanaland. Its shortest frontier of all is the Cape of Good Hope on the south. The population numbers about 100,000 natives and 15,000 German settlers. There are two ports on the coast; Lüderitz Bay and Swakopmund. Near the latter is the little British enclave of Walvis Bay, used as a trading and whaling station. Diamond mines were discovered near Lüderitz Bay in 1906, and copper is also found in the country. There are some hundreds of miles of bleak and sandy desert which presented many difficulties to the Union forces invading the country.

The British Government attached great importance to the conquest of German Southwest Africa and offered a loan of £7,000,000 for the expenses of the campaign.

General Botha planned an enveloping movement against Windhoek, the capital, about 200 miles from the coast. He divided his forces into two armies, the northern under his command to use Swakopmund as a base and to follow the railway to Windhoek. The army of the south under General Smuts was divided into three separate columns. One under Sir Duncan Mackenzie was to move East along the railway from Lüderitz Bay. Another under Colonel Berrange was to invade the colony from the east, and a third column commanded by Colonel Van der Venter was to march north along the line running down Warmbad to Keetmanshoop. Botha's plans, if successful, would drive the German

forces away from modern communications into a waterless desert region, from which they could not easily escape.

The two German ports were occupied, and at the beginning of February, 1915, the four principal gates into the colony were in Union hands. The outcome of this campaign in the second six months of the war is narrated in Volume III of this history.

CHAPTER XCIX

ATTACK ON GERMAN EAST AFRICA

LET us now survey the conditions in German East Africa, the greatest of the German colonies, during the first six months of the Great War. It is twice the size of European Germany, and has a population of 8,000,000, which includes about 5,000 whites. Having Britain for a neighbor on the north and part of the west borders, and with a coast of 620 miles, the colony was in a position to invite attack, and also to invade the enemy country of British East Africa. Had the Germans known of the military weakness of the British during the first weeks after war had been declared, they could have easily conquered their neighbor, whose defense force at the time has been estimated at less than 1,200. For some reason the Germans did not make the most of their opportunity, and during the early weeks were only making sporadic attacks of small importance on the south and west borders. On August 13, 1914, a British cruiser bombarded the German port and capital, Dar-es-Salaam. Landing parties destroyed the new wireless station, sank the floating dock and survey ship *Moewe*, and dismantled German ships in the harbor. On Lake Nyassa on the same day the German steamer *Von Wiseman* was surprised by the British steamer *Gwendolin* which captured the captain and crew and made her useless.

On September 5, 1914, Brigadier General J. M. Stewart arrived at Nairobi with a battalion of Imperial Service troops, the Twenty-ninth Bunjabis, one battery of Calcutta Volunteer Artil-

lery, a battery of Maxim guns, and one mountain battery. General Stewart assumed command of the British force at a critical moment, when the Germans had just commenced operations against the Uganda railway. In the third week of August they had seized the little frontier post of Taveta near their chief military post of Moschi, and on the coast south of Mombasa had captured Vanga.

The Uganda railway at Maungu was blown up early in September, 1914. The expedition that did this work had a curious, and, in the eyes of their enemies, an amusing experience. It seems that the excellent German maps, which served to guide them within twenty miles of their objective, stopped at that point, and they were forced to use English maps. These were incorrect, and consequently they missed the water holes, went eight miles out of their way, and were captured to the last man.

Fighting in Africa is quite a different thing from fighting on the continent of Europe where climatic conditions are seldom oppressive. In the inhospitable colony of German East Africa, the British soldiers endured much suffering. And where was the glory, a soldier complained, in being potted by an unknown man you could not see, near some place whose name you could not pronounce, and whom no one had ever heard of? And to be buried far from home and the land of your birth, this was a bitter thought indeed.

It speaks well for the *morale* of the soldier that he did not fail "to do his bit" while marching and fighting in this pestilential climate, where any exertion is followed by intolerable weakness.

A German force of 600 men on September 6, 1914, had marched down the Tsavo River, but their advance was delayed by Lieutenant Hardingham and a company of King's African Rifles, who worried them day and night, but were not strong enough to attack. These obstructive tactics gave time for reenforcements to arrive, consisting of several companies of the King's African Rifles and half a battalion of the Twenty-ninth Punjabis. Hardingham was now ready to strike at the enemy and an engagement was fought about five miles from the Tsavo railway bridge, which scattered the Germans in confusion. This success cleared

the way to establish advance posts at Mzima and Campiy Marubu, which places though repeatedly attacked by German forces, the British continued to hold.

On September 10, 1914, the Germans crossed the frontier on the north and occupied Kisi near the Victoria Nyanza. Surprised two days later by two companies of the King's Rifles, native police and several Maxims, they were driven out in disorder, and retired to the lake port of Karungu. The British steamer *Winfred* having sunk two German dhows on the lake, entered Karungu Bay to relieve the town. Driven off at first, she was joined by the British steamer *Kavirondo* and returned to threaten the port which the Germans hastily evacuated, and then retreated over the border.

Of the many attacks along the northern frontier in September, 1914, the most threatening was an advance along the coast toward Mombasa from Vanga. An attack by land and water had been projected, but the *Königsberg*, which supported the expedition, failed to shell the town for some reason and played no part in the subsequent engagement. The Germans who were 600 strong, with six machine guns, were nearly successful in their land attack, but were held up at Gasi for several days by Captain Wavell's Arab Company, and King's African Rifles from Jubaland, until reenforced by Indian troops on October 2, 1914. In the desperate fighting that followed, all the European officers were wounded, and the command of the King's African Rifles fell to a native color sergeant. It was owing to this man's bravery and skill, that the British were victorious, for he headed the charge which dispersed the enemy.

During the remainder of October, 1914, the British stood on the defensive, waiting for a big Indian force that was expected to arrive in November. The German attacks had slackened, but they already occupied territory at De Longido on the Romba River, and at Taveta and had an advance post between the Romba and the Tsavo.

On this campaign the Europeans suffered intolerably from heat and thirst, and military operations were difficult, owing to the nature of the country. There were no maps, or roads, and

owing to the presence of wild beasts picketing and scouting were attended by many dangers. A waterless desert covered with bush and thorny scrub stretches along the northern border, and where the pitiless sun makes a weakling of the strongest man. Fortunately for the British most of their officers had hunted big game in this difficult country, and were accustomed to the climate, while their bush-bred African levies suffered little or no inconvenience.

On November 2, 1914, a second Indian Expeditionary Force commanded by Major General Aitken and escorted by two gunboats arrived at the German port of Tanga and summoned it to surrender. The officer in charge asked for time to communicate with the governor who was away, and this was granted. The Germans took advantage of this delay to bring down every available soldier by the Moschi railway. As the evening advanced, General Aitken became impatient, and landing one and one-half battalions on the coast, advanced on the town. The Germans had prepared a strong defense and the British were forced to retreat to the shore and the cover of their gunboats.

Having landed the remainder of his force, General Aitken again advanced to attack the town on November 4, 1914. The result was disastrous. The Germans showed a perfect knowledge of bushfighting and its devious methods, and had prepared some painful surprises. Hives of bees were hidden along the roads which swarmed out and stung the invaders, when the lids were twitched off by concealed wires. Ropes hidden under the sand when stepped on displaced flags and gave the Germans the required range for their artillery. In spite of these ingenious devices to hold them back the British force reached the town.

The Kashmire Rifles and the North Lancashires forced an entrance on the right, while on the left the One Hundred and First Grenadier attacked with the bayonet. But the odds against the British troops were too heavy. Met by a fierce enfilading fire from the housetops they were forced to retire and reembark. There were nearly 800 casualties, which included 141 British officers and men, making the Tanga disaster one of the costliest that had been fought up to this time on African soil.

An attack on Longido the fort in British territory held by the Germans, had been arranged to coincide with the movement against Tanga. The East African Mounted Rifles and an Indian contingent detailed for the work, were forced to fall back with heavy losses, and Captain Sandbach of the First Royal Dragoons was killed.

The British attack was now, however, an entire failure, for on November 17, 1914, the Germans quietly abandoned the fort and the British occupied it.

A German force invaded Uganda on November 20, 1914, and after several repulses forced the garrison to retire from Kyaka Fort, on the south bank of Kagera River. Many isolated engagements were fought along the border, but in January, 1915, the British suffered a second important defeat. The Germans had invaded British territory by way of the coast after their victory at Tanga, but were driven back. At the beginning of 1915 the British borders were clear, and the British occupied the post of Jassin, twenty miles inside German territory.

A German attack on January 12, 1915, was beaten off, but six days later the enemy returned 2,000 strong, with artillery and machine guns, and began a vigorous assault. The garrison fought with great spirit, but was forced to surrender when the ammunition gave out, and some 240 men became prisoners of war. A party of Kashmir Rifles succeeded in cutting their way through the enemy, and with the loss of half their number reached the British lines. The Germans lost in this action 57 whites killed and wounded, including 7 officers, while their native troops suffered heavily. The Germans could now rightly claim that they had freed their East African territory of the enemy and that they also held some posts inside British borders.

PART X—WAR IN THE AIR AND UNDER THE GROUND

CHAPTER C

EXPLOITS OF THE AIR FIGHTERS

THE eye of an army is in the air. Like Argus of old the aeroplane sees everything. Massed troop movements, scurrying cavalry, feint attacks in force, no longer deceive the opposing commander. They have gone before, along with much other panoply of war. Enemy movements of to-day are accurately known to friend and foe. Every hour aeronauts bring in reports of battery positions, ammunition columns, infantry marching from here to there, with a concentration in order at a point where the next day's communiqué probably will locate a stiff fight.

Without modern aircraft it is probable that the impassé on the western front never would have developed. One side or the other must have blundered and been overwhelmed at some point. Then the legions would have come pouring through and a decisive battle fought. This always has happened before. With a few variations it is the history of war. Former methods of information, cavalry patrols, spies, and so on, left much to guesswork. The general who could read his enemy's mind most accurately was the winner.

The aeroplane, supplemented by the airship, is the factor that has brought war to something like a business organization. Upon the army pilots' judgment, technical knowledge, courage and skill depends the safety of thousands. Every airman is a general in embryo, more entitled to that rank than many a commander of bygone days. To be a successful army aeronaut is to have a first-

rate mental equipment, a stout heart, and some very complicated knowledge of distances, geography, gunfire, and a thousand other things. The aerial branch of the different armies developed a fine type of man, and the heroes of the air stood foremost on the honor roll of the war.

Soon after the conflict started aerial raids and clashes between opposing machines began. The world was electrified by a report in August, 1914, that Roland Garros had rammed and destroyed a Zeppelin, losing his own life. It later developed that he was not killed, and Berlin denied the fact, but it stands on the record.

On August 20, 1914, a Zeppelin was brought down by French gunfire in a wood near Epinal. The wreckage was carried to Paris and displayed, bits of the framework bringing good prices as souvenirs, the money being devoted to the wounded. Ten days before the French capital had seen its first enemy birdman. Several bombs were dropped with small damage. As the German armies drove through Belgium and on to the Marne German air reconnaissances above the city became frequent. There was some dropping of bombs, although the unwelcome visitors occupied themselves principally with locating defensive positions.

A French airman shelled Metz on August 10, 1914, damaging an airship shed. This was the first Ally raid into Germany.

One or more Zeppelins flew over Antwerp, August 25, 1914, when it still was held by the Belgians, and released explosives which resulted in the death of twelve persons and the injury of many others. The Royal Palace, where King Albert, his Queen and children were housed, appeared to be the special objective of this raid, three or four bombs falling within the immediate neighborhood. The hospital of St. Elizabeth narrowly escaped. German confederates were believed to have signaled the Zeppelins where bombs should be directed. For the second time that night and again on September 1 other attacks were made, but without special incident. The initial visit was the first German raid of any consequence that brought about the killing of civilians and caused a great outcry from all the world.

Ostend was occupied by British marines on August 27, 1914, and a strong squadron of British flyers arrived the next day.

They immediately took up the burden of air patrol work on the extreme western end of the front and have borne it ever since.

The most serious loss in Paris during the first period of the conflict occurred September 1, 1914, when a Taube flew over the city shortly after six o'clock in the evening. It was observed above the Gare St. Lazare, where one bomb fell. Antiaircraft guns began firing at the raider, whose reply was to proceed to the Place de l'Opéra. A second missile was thrown there. French craft then drove off the marauder, but fifteen persons were said to have been killed by the first bomb. The next few days saw other aerial attacks, all details of which were suppressed. Some lives undoubtedly were lost. With the defeat of the invaders on the Marne bomb dropping in Paris was reduced. The greater distance of the new German lines and the increased watchfulness of the Paris air patrol made the work more difficult.

A German lieutenant and his observer were picked up off Borkum on September 3, 1914, by a British submarine, the motor of their seaplane having failed. Typical of the Allies' activity in the air was the blowing up of a German ammunition column at Doullens, nineteen miles from Amiens, September 16. This was accomplished by a British aeroplane, and was one of the earliest authenticated attacks of the kind. The Russians accounted for another Zeppelin in the early days of September, the big dirigible falling a victim to field gunfire during the Russian invasion of East Prussia. Aeroplanes played a large part in the maneuvers on the eastern front, but were little used for offensive purposes.

By this time airmen on both sides were becoming very expert in their duties. The number of flights increased, there were battles above the earth almost daily, and numerous French cities near the front were shelled by aircraft. This brought about a restriction of lighting, street lamps being cut to the minimum, illumination in houses checked, and powerful searchlights mounted at convenient points to scour the heavens for raiders. These precautions were taken throughout northern France, and England soon followed suit, London now being wrapped in a darkness that smacks of the Middle Ages.

German cities had a taste of the new warfare. Flight Lieu-

tenant C. H. Collet and five other airmen of the British service flew a distance of 200 miles to Dusseldorf on September 22, 1914, and dropped explosives upon an airship shed. Two of the squadron made their way to Cologne, but owing to the misty weather were unable to locate airship sheds or munition plants and refrained from injuring civilians.

Five machines under Squadron Commander D. A. Spencer Grey left Antwerp, October 8, 1914. Commander Grey directed his course to Cologne with two machines and circled above the city at a height of 600 feet, being subjected to a continuous fire. Severe damage was inflicted on the railway station and other military points.

Lieutenant Marix proceeded to Dusseldorf the same night and dropped bombs upon a Zeppelin shed. The structure caught fire and was destroyed with a Zeppelin inside, reports said. The three attacks, following in quick succession, caused something akin to consternation in cities along the Rhine, although not a single German noncombatant had been injured up to that time. General von Bissing, who then commanded the district, issued a proclamation calling on the people to be firm.

St. Omer, Dunkirk, Calais, and Boulogne were each raided several times during the mid-period of October, 1914. The main purpose of the Germans was to ascertain what reinforcements the British were transporting across the channel, the destruction of lives and property only incidental.

Notre Dame Cathedral, Paris, was struck by a bomb dropped from one of two Taubes that paid the city their respects on October 11. The missile failed to explode and only trivial damage resulted. This was on a Sunday afternoon, and inaugurated a series of Sunday raids that lasted six weeks.

Twenty bombs fell upon the city October 11, 1914, four persons being killed and thirty-four wounded. The raiders unloosed several bombs at Notre Dame, but the splendid edifice was not seriously injured, the northern tower merely having a small hole torn in the roof. Information as to the succeeding raids was kept secret. It is likely that upward of fifty victims died in the several visits of the German machines.

October 15, 1914, was marked by a conflict between four French machines and a squadron of German cavalry. Such a fight had never before taken place. The birdmen chased the cavalry squadron all day, letting go an occasional bomb that kept the troops moving. Finally they made a sudden swoop downward and released all of their remaining explosives, killing most of the Germans and their horses.

French machines brought down a Taube east of Amiens on October 24, 1914. The next day four bombs were thrown into Verdun, the great stronghold of northern France. There was no loss of life.

Kaiser Wilhelm narrowly escaped death when British aeroplanes shelled his headquarters at Thielt, November 1, 1914, which he had just left. Several members of the imperial suite were killed. This raid, it was said, followed specific orders by Sir John French, now viscount, who then was commander in chief of the British forces. The kaiser treated him harshly at maneuvers in Germany a few years before, when the general attended as a royal guest. He never forgave the offense, so the story runs.

French and British machines succeeded in blowing up Fort Englos at Lille, held by the Germans, on November 4, 1914, and followed up this stroke the next day by destroying Fort Carnot. Both stored great quantities of explosives and a number of German troops were killed. Previous attempts had been made to the same end, but without important results.

It was announced in Berlin on November 8, 1914, that three German airmen had met death in the pursuit of their duties, and six others injured since the war began. Allied figures placed the casualties at several times that number.

French Dragoons came upon a German aeroplane squadron being transported to the front by wagons on November 20, 1914, near Soissons. A fight ensued which cost the lives of nearly all the dragoons, but not until they had made kindling wood of a half dozen German planes. The exploit is unique in a war of odd conflicts.

The 21st of November, 1914, saw a raid by Squadron Com-

mander E. F. Briggs, Lieutenant J. T. Babington, and Lieutenant S. V. Sippe upon Friedrichshafen, on Lake Constance, where one of the principal Zeppelin works is located. The trio started from Belfort, a French fortress, 250 miles distant. Zeppelin sheds and a gas factory were shelled, all of which caught fire. At least one Zeppelin was said to have burned. The three machines were hit and Commander Briggs had to alight. He was threatened with bodily harm, although painfully injured. A German officer rescued him. France awarded the Legion of Honor to each of the three raiders.

Before hostilities began Mülhausen in Alsace sheltered a plant where the *Aviatik*, one of the best German machines, was built. French airmen made this plant the special mark of numerous sorties, and before the city was taken by French arms, only to be lost again, the factory was removed to Freiburg, in the Black Forest. Enemy airmen followed it up and Freiburg repeatedly has been shelled from the air. Two of these attacks were made in late November.

Throughout November, 1914, German forces in Flanders devoted especial attention to the British army service, repeatedly attacking transport columns, railway points and other rallying places for men and supplies. Hazelbrouck was subjected to an air raid on December 7, 1914, three children and the same number of adult civilians being killed. Visits of this kind were so frequent that little attention was paid to them except in cases where non-combatants met death.

December, 1914, however, was an unfortunate month for the air pilots. The attempt to keep up with the enemy occupied the available men on both sides, and the weather was unfavorable. Nothing of any consequence happened until Christmas Eve, when Dover was visited by raiders. Several buildings were damaged, but there were no casualties. The next day a Taube penetrated to Erith, on the Thames, which was the farthest point inland known to have been reached up to that time.

This same Christmas Day, 1914, brought forth a historic incident. For the first time warships and seaplanes engaged Zeppelins, aeroplanes, and land fortifications. Led by Squadron

Commander Oliver, seven seaplanes left England early in the morning and foregathered at a point near the island of Helgoland. Several cruisers and a squadron of destroyers served as a convoy. The airmen made directly for Cuxhaven, at the mouth of the River Elbe, seventy miles from Helgoland and but a few miles from the entrance to the Kiel Canal. They engaged enemy aircraft, dropped many bombs and spread consternation for three hours. Both shore works and the German fleet were subjected to aerial bombardment, with the attacking machines almost constantly under fire during the period of their visit. The British ships were attacked by two Zeppelins and a flock of aeroplanes, but the pilots showed caution, particularly the two Zeppelins, and would not come to close quarters. Submarines also tried to approach the cruisers but could not evade the destroyer flotilla. There was fighting on the sea, beneath the water and in the air, the first time a general engagement of this kind was ever attempted.

One Zeppelin was destroyed in its shed on this raid, according to reports emanating from Germany. What other damage may have been done is uncertain, but the primary object was to estimate the number and disposition of warships and shore batteries at Cuxhaven. In this the undertaking was notably successful, giving the British admiralty definite information of the forces at the point attacked.

Of the seven British seaplanes three returned safely to the cruisers, three others were hit and lost at sea, the pilots being picked up by destroyers. The seventh man, Flight Commander F. E. T. Heylett, was rescued and interned in Holland after a Dutch fisherman had saved his life. He fell into the water with his machine about eight miles from Helgoland and it was one of the surprising features of the raid that he escaped capture.

Meanwhile sporadic attempts were made to teach England that great lesson which Germany had promised without special success. Coast towns had been shelled by airships, but there was little to show for the Germans' efforts.

Yarmouth and several other Norfolk villages were the mark of Zeppelins on January 19, 1915, when two persons were killed

in Yarmouth and King's Lynn. A shoemaker and an aged woman were the victims in the first place, a soldier's widow, and a boy of fourteen died at the second. A soldier and a few citizens were wounded at Yarmouth. These were the first victims of aerial warfare in England, and their death aroused the nation as probably nothing else had since the conflict started. It is certain that the raiders were Zeppelins, owing to the size and number of bombs dropped. In addition to the towns named, Cromer, Beeston, Sheeringham, Heacham, and Snettisham were shelled. The property damage was heavy.

Further Zeppelin raids came with the passing weeks, none of which assumed serious proportions until the return of summer.

Dunkirk, British headquarters in France, was shelled every day or two from the air during January, 1915. A few fatalities and considerable destruction resulted. The main object was to disorganize British arrangements, but increased watchfulness and a large number of machines soon gave Dunkirk better protection. Many duels have been fought above the city and aeroplanes lost on both sides.

Two members of the British aerial forces shelled the harbor at Zeebrugge, Belgium, converted into a submarine base after its capture by the Germans, and sunk one undersea boat on January 22, 1914. This again was a new achievement in war, which has been followed by a number of conflicts between aircraft and warships of various sorts. The Italians are believed to have sunk at least two Austrian torpedo boats in this manner, a French aeronaut made away with another off Ostend, and other similar clashes have taken place.

CHAPTER CI

DEVELOPMENTS IN AIR-FIGHTING
MACHINES

AT the outset of the war the nations engaged knew a good deal about aerial science and were in various stages of preparedness. Germany had worked strenuously to develop the rigid airship, lavishing her efforts on the Zeppelin, but not forgetting the aeroplane. Austria possessed an indifferent equipment in both branches, Italy was somewhat better off, and Russia in a transition state where great steps forward had been made, but with an inadequate number of machines. Great Britain was in the same dilemma, but did have an excellent naval service, to which she had directed much attention.

France, after the Wright brothers showed that an aeroplane could fly, began the intensive development of aircraft. But the work was carried on in private channels rather than by the Government. The French air service was in many ways the best of all the air corps engaged, but probably not so well organized as the German. The record of France in aeronautics is a brilliant one, and to her is due many of the vital inventions that have made flights by aeroplane possible. Particularly in motor construction have the French excelled. Before hostilities began her aviators had been accustomed to set new world records almost at will, and no sooner had the war started than they rallied to the colors. Such men as Garros and Pégoud, the former captured, and the latter killed, became simple privates. Thus, in the beginning, France had the most daring and expert pilots, the Germans acted more as a unit, and the British had hit upon a middle course that was notably efficient. And the Russian airmen were soon to earn a reputation for daring that gives place to none. Austria has made a few spectacular raids on Venice, Ancona and other Italian cities, and the Italians have replied with consistent patrol and reconnaissance work. They have some splendid dirigibles, developed by themselves, which

are exceedingly trustworthy, though only half the size of a Zeppelin.

A high officer of the United States army told a Congressional committee investigating military affairs that the French flying corps had more men attached to it than the entire armed force of the United States. This is indicative of the attention bestowed to aerial work and reveals the prodigious efforts made since the war began to meet new conditions. There are no reliable figures as to the number of machines and the men who were engaged in flying on either side. But there are many fairly accurate estimates, of which the following, both by experts, are useful. The figures are based on strength of the various corps at the beginning.

Country	Dirigibles	Aeroplanes
France.....	31	1,200
Great Britain...	15	500
Russia.....	16	800
Belgium.....	2	40
Serbia.....	0	40
Germany.....	35	600
Austria.....	10	350

Country	Dirigibles	Aeroplanes
Germany.....	22	320
Austria.....	7	100
France.....	16	834
Russia.....	10	164
Great Britain...	6	250
Belgium.....	2	40
Serbia.....	0	10

Somewhere between these two sets of figures probably lies the truth, with the odds favoring the larger estimate. The entrance of Italy brought the Allies about twenty-five additional dirigibles and from 200 to 300 aeroplanes. The preponderance always has been with the Allies, but Germany has to her credit the greater number of raids calculated to impress the public

DEVELOPMENTS IN AIR-FIGHTING MACHINES 601

mind—raids in which destruction was spread and the loss of life heavy.

Pégoud, Garros, Immelmann and Warneford, each name stands for brave deeds well done. The first two, both Frenchmen, were famous before the war started as daring pilots who courted destruction upon many occasions. Hostilities brought their fame to a climax. Immelmann, the German, has figured in the day's news for many months as the most daring of German pilots. His record of machines brought down is said to exceed a dozen. The name of Warneford ranks alone. While returning from an early morning flight over Belgium he sighted a Zeppelin homeward bound from a nocturnal trip to England's shore and gave battle. The Zeppelin tried to run, but the young Canadian, serving in the British service, ascended above the dirigible, dropping bomb after bomb upon the gas bag, being under fire himself all the while. Apparently the Zeppelin could not be injured by his missiles. He had but one bomb left. That he flung downward in his last effort. Suddenly there was an explosion, a sheet of flame and rush of air that turned Warneford's machine completely over. He righted it and watched the Zeppelin fall to earth. The Victoria Cross and Legion of Honor were awarded him. A few days later he was killed on an aviation field near Paris when his machine failed.

To Americans the war in the new element was of supreme interest for many reasons, as many were engaged in it. The French flying corps included twelve or fifteen Americans. Some of the best known were William Thaw, a second lieutenant; Norman Prince and Elliott C. Cowdin, both corporals; J. W. Bach, Bert Hall, Frazier Curtis, D. W. Masson, and H. G. Gerin. Several of them were honored for gallant service.

The size and famed powers of the Zeppelin seize upon the imagination, and the Germans had thought that the huge craft would spread terror among their foes, particularly the civilian population. A campaign of suggestion carried on through the press of the world long before the war was diligently followed up after the start of hostilities. Marvelous accounts were given of Zeppelin fleets that could cruise for thousands of miles with a

formidable crew of men and enough explosives to wipe out whole cities. It was hinted that Germany had dozens of these airships.

During the last decade, and especially the last five years, the pet bogey of England has been an invasion by air. Newspapers gave frequent prominence to stories of strange midnight visitors who came in ghostly flying machines. First they were seen in Scotland along the coast, then throughout the British Isles. The nerves of the nation were pitched to believe almost anything that had to do with a host of Zeppelins or monster aeroplanes that would drop death from the sky and level England's might. Germany knew this and fostered the feeling. But once the war was on and the Zeppelins had come, were seen and heard, and their worst deeds viewed in the wreck of a few buildings with a few casualties, the British recovered their poise. The bogey had lost its power. There was more curiosity in London after six months of war over a Zeppelin visit than aught else, and it was this very curiosity that brought throngs of people into the streets when the raiders came, thereby increasing the number of persons killed and mangled.

This largely is true of Paris, the mark of the Zeppelin was left on a good many occasions during the first period of the war, but in later months the city was almost immune from attack. The fact is a tribute to the French flying corps, which found adequate means to check the Zeppelin. There never was the same dread of aerial attack in Paris as in London, due perhaps to the French temperament and the habit of living nearer to an ever-present danger.

The Zeppelin is an outgrowth of the balloon, a discovery of the brothers Montgolfier, who demonstrated at Avignon, France, in 1782, that a silk bag containing heated air would rise from the ground and support itself. Soon afterward gas was substituted for air, and by degrees the balloon evolved until it could be released from captivity and at least partly controlled. At the battle of Fleurus in 1794 the French used a balloon for observation, which marked its entry into the scheme of war. Count Ferdinand von Zeppelin is said to have procured the basic idea for his invention from an Austrian engineer named Schwarz,

DEVELOPMENTS IN AIR-FIGHTING MACHINES 603

taking over certain patents held by the latter. But to him alone credit is due for developing the great airship that bears his name.

With a length of from 300 to more than 500 feet even the largest Zeppelins have a diameter slightly under fifty feet, which means least possible resistance to the wind when traveling against air currents. The most recently built Zeppelins have about 800,000 cubic feet gas capacity, with a car at either end beneath the hull. Four motors of from 180 to 200 horsepower and two sets of propellers create driving power. A system of rudders guide the big craft.

A Zeppelin frame is made of the finest aluminum, separated into from sixteen to twenty-four sections, each containing a gas bag. One or more of these may be damaged and the gas discharged without causing the airship to fall. Under the center of the frame and between the two cars is an armored cabin resembling a ship's cabin where the crew lives. This is provided with guns and all needed equipment. Above the gas bag is a platform bearing one or two machine guns, reached by a stairway passing between two of the compartments.

Wireless apparatus is another feature of the Zeppelin, which also is equipped with a device for dropping bombs. Estimates as to the Zeppelin's radius of action and carrying capacity vary. The best authenticated opinion places its maximum load at five tons, although other estimates increase the figures to eight tons. This includes the aggregate weight of the crew, fuel, water and supplies, which would enable the dirigible to transport something like one and a half tons of ammunition. It has the longest cruising power of any aircraft developed up to this time and holds the altitude record for dirigible balloons, having risen to more than 10,000 feet. It is known that the Zeppelin can travel 1,200 miles without replenishing its supplies, and some of the newer type are said to have a radius of from 2,000 to 3,000 miles. This is doubtful. Their highest speed is placed at fifty-two miles an hour, which may be increased to upward of a hundred miles an hour when flying with the wind. The usual crew is between twenty and thirty men.

The Zeppelin's disadvantages are numerous. Owing to the

far superior speed of aeroplanes the monster airships are always in danger of successful attack from these puny antagonists. The whole principle of aerial warfare depends upon the height and rapidity with which a machine can mount into the air. Aeroplanes rise faster than a Zeppelin and have attained an altitude of 26,000 feet. They present an infinitesimal target as compared to the Zeppelin and maneuver more readily. Thus the German's principal achievement in aerial science is almost at the mercy of their enemies under ordinary conditions, although the Zeppelin mounts heavier guns and has the asset of a steadier position from which to fire.

Another distinction between the airship and the aeroplane is that the aeroplane must be constantly in motion, while the Zeppelin can remain stationary, or nearly so. But this is overcome through the aeroplane's ability to drive off and outmaneuver its larger adversary. Because of this the Zeppelin is employed only at night, save in rare instances. To sum up, it is in reality a clumsy affair, unmanageable with a gale blowing and has been shown to have but little use except for night time depredations. Many Zeppelins suffered severely in storms, and at least a half dozen have been lost since the war started as a result of the elements. Unless securely put away in their sheds they will break from moorings and float away should a stiff breeze come up while they are on the ground. Numerous accidents of this sort have happened, many men being hurt in striving to keep the big craft on earth. Each Zeppelin must have a retinue of attendants, for repair work is frequent and difficult. What their future may be is an unanswerable problem, but it is certain that they have failed to prove a scourge for Germany's opponents in anything like the degree expected. By its very unwieldiness the Zeppelin is its own worst enemy.

All aeroplanes are built on the same general principle. Driving force is procured by a gasoline motor that in some cases will generate 200 horsepower. The motor sets in motion one or more propellers, and the wings or planes serve to balance the machine, which is guided by a rudder at the rear end. Aeroplanes are of three kinds—monoplanes, biplanes, and hydroaeroplanes. The

first is distinguished by the fact that it has two planes, one on each side of the machine, with the propeller at the forward tip of the frame. Biplanes have two planes on each side, one above the other, and the propeller aft. The hydroaeroplane is substantially the same as the biplane, but is equipped with pontoons, and the body is built in the form of a boat, enabling it to either fly above or skim over the surface of the water. They are used almost exclusively by warships and have rendered valuable service. The British navy excels in this class of aircraft, having devoted special attention to aerial science in the naval arm. An aeroplane can be started with a 50-foot run, and will alight and come to a halt within a little more than that distance if necessity requires. On starting, the aviator endeavors to rise against the wind, and must always alight in the face of the current. Some of the smaller machines are constructed to carry only one man, but the majority accommodate two. From one to two hundred pounds of bombs constitute a full load, excluding the big battle planes, of which France has the larger number. These machines have room for several men, mount a gun forward and aft and will sustain a proportionately heavier load of ammunition.

Bombs are released from the bottom or side of the car by a trigger device. Accuracy only is possible when the machine descends to a height of 2,000 feet or less, preferably a few hundred feet. Being easily within range, at such times the airman's work is extremely hazardous.

Even the slowest aeroplane can travel at a rate of forty-five miles an hour, and the newer models commonly make from 75 to 100 miles an hour. The fastest machines attain a speed of two miles a minute for short periods. No machine can fly slower than about thirty-five miles an hour and stay afloat. The cruising capacity of all types varies from 100 to 600 or 700 miles, longer flights being rare, although many planes travel 300 to 400 miles without alighting, sometimes in squadrons. The rate of progress determines to a large extent the time a machine can stay in the air, high speed burning up fuel so rapidly that flights are limited to a few hours.

The small machines of one-man capacity nearly always are

defenseless, only the most expert aviators being able to manipulate a gun and manage their craft. Pégoud was the first to accomplish this feat.

The constant effort of all the nations is to lighten the mechanical apparatus of flying craft and to promote speed and carrying capacity. Recently the Germans have been abandoning the Taube machine in favor of a biplane copied after the Henri Farman model, which is one of the distinctive French craft. It is more dependable and faster.

Many devices have been tried to lessen the noise of aeroplane propellers and conceal the machines from view while in the air. A favorite ruse, of course, is to hide amid the clouds and watch enemy positions. The Germans carried this idea a step further and invented a gas bomb which throws out a great pall of black smoke, furnishing airmen with a temporary cloak against unfriendly eyes. Another type of bomb gives out a misty volume of smoke exactly duplicating a cloud. Both airships and aeroplanes are supplied with these bombs.

To the Germans goes the credit for another clever ruse of war in the air. This is a car which suspends several hundred feet below the hull of a dirigible, and from which observers may reconnoiter while the airship is floating above a cloud. The car itself will be invisible except to the keenest eye, aided by an unusually powerful telescope.

The problem of invisibility is one to which the best scientific brains have been given endless thought. Several times the Germans have claimed a solution. It was announced that a combination of cellulose and acetic acid rendered a machine safe from the eye at 6,000 and nearly so at 3,000 feet. Whether this claim is well founded cannot be determined. The Germans also have built aeroplanes with wings made of synthetic resins, having the same end in view. Pronounced success has resulted, according to German circles.

Russia developed the largest type of aeroplane. It is known as the Sikorsky, has an armored body and room for from six to eight men. Two or three machine guns, and usually one field piece of about 3-inch bore, represent its armament. These ma-

chines are exceedingly powerful—just how powerful it is difficult to say, as the Russians have carefully guarded the secret of their construction, and there is no record of one having been captured. But they are known to have proved valuable auxiliaries of the army, and it is reported that Russia has embarked on a campaign of building, which contemplates numerous fleets of the Sikorsky machines. They are equipped with complete wireless outfit, being able to either send or receive messages, it is said. This is a great step forward, as no practical device for transmitting wireless signals from an aeroplane has yet been brought forward by either Russia's allies or opponents. Many machines carry equipment to receive messages, but must return to their lines with a report of enemy movements. What it would mean to instantly communicate important information from a position miles away is readily perceivable. As a substitute, the birdmen use showers of paper by day and parachutes with a red torch attached to indicate the foe's location at night. The method is a very good one, so far as it goes, but every belligerent eagerly awaits the time when aeroplanes may send wireless dispatches.

The best monoplanes are faster than the best biplanes. The latter are able to carry a gun at the forward end, and even with inferior speed sometimes have the monoplane at a disadvantage. With a whirling propeller always in motion, it has been deemed impossible to place a gun on a monoplane in such wise that its fire would be outside the propeller's radius when shooting straight ahead. In consequence guns were mounted at either the right or left side. When attacking or trying to drive off a foe it has been necessary to jockey for a position from which the observer could fire.

This handicap is said to be completely overcome in the Fokker, which has armored propeller blades, according to good information. The line of fire is directly through the propeller's zone of action, and such bullets as strike the blades are deflected. It is claimed that not more than five out of a hundred bullets strike the blades, and that it is impossible for the occupants of the car to be hit by a recoiling bullet.

The Fokker is equipped with a motor of from 110 to 120 horse-

power, and has a peculiar facility for performing spiral evolutions that bring it near an enemy plane while offering but a small target. Its tactics are different from the hitherto unvarying rule that aerial combats are won by the machine which gets above its enemy. Instead, the Fokker is reported to often seek the lower position, and, firing in a straight line, literally tear out the bottom of the other machine, much in the fashion that a shark would attack a small boat. The Fokker in reality is a shark of the air.

The conquest of the air has proceeded in such a way that the dreams of yesterday seem certain to be realized to-morrow. What the novelists conceived as a possibility has become a fact. We are face to face with a new mode of war that already has shown the futility of strong walls when the cities they protect are defenseless from above. Considering the youth of aircraft and the remarkable efficiency attained, it appears reasonable to believe that the future will see huge dreadnoughts of the air, even larger than Zeppelins, capable of flying for thousands of miles, and otherwise comparable to the biggest battleships of the sea. There are already aerial destroyers and machines built especially for pursuit. Perhaps we shall see battles in the new element on the same tactical plan as those of the sea. It is possible that a nation to control the world must not be the stronger upon the sea alone, but in the air as well. It may be that control of the sea would not counterbalance control of the air—that the air fleet could dictate to the rulers of the sea.

The aeroplane of the future, if it realize the hope of man's genius, will be silent and invisible, firing a noiseless and smokeless gun, cruising great distances—the true winged messenger of death.

CHAPTER CII

WAR UNDERGROUND—THE TRENCHES

THE Great War, as we have seen in the preceding chapters, inaugurated many new epochs. It was the beginning of a new era of invention—the development of warfare into a great science. It proved the value of engineering as a decisive factor in battles. More crucial battles were probably won by engineering skill than by the valor of the soldiery.

The most remarkable of these innovations was the great system of trenches which changed the whole method of warfare and completely upset the calculations of armies. It is necessary, to obtain a clear understanding of the European campaigns, to study very carefully this system of trench warfare.

Did the Germans foresee trench warfare and prepare for it in advance? Certain it is that they displayed great genius in this new science. It first appeared after their retreat from the Marne, following four days' fighting, September 6 to 9, 1914, when they reached the neighborhood of the Aisne, where the French found them securely dug in. Much mystery surrounds this stand of the Germans. Tales have been told of concrete gun emplacements built long before by German agents, and of defensive positions selected in advance by the General Staff, which were turned into a miles-long earthwork, anticipating a retreat from Paris.

The Germans faced about at a point north of Peronne, eastward to the St. Mihiel salient, between Verdun and Nancy, links in the barrier of border fortresses which had held up their efforts to advance in the first sweep of troops on to French territory. The wing of the army which did get through extended from the St. Mihiel position north and west to the vicinity of Peronne, and here it was that the French found them intrenched after the battle on the Marne. By degrees the sinuous line of ditches stretched to the Swiss border on the one side and, after a great flanking operation by all the armies engaged,

ended only when the sea was reached, to the Flanders coast. Lille fell, Ypres held, the trenches passed around. Like two Titans the opposing armies have wrangled along this embattled front, for many weary months have waited for a chance to deliver a telling blow. The Germans tried hardest at Ypres, around Rheims and in the Argonne; the French in Champagne and near Lens, with British aid at the second point. But every slight advance has had only one result: new ditches, more ditches. To the men in them it is a world of ditches and existence, the carving out and keeping open of a wound across the face of a continent.

During the campaign through Belgium neither side resorted to trenches other than the shallow rifle pits which had been handed down in the tactics of former wars. The Germans had no occasion to show their plan, if such they had, and the Belgians but little chance, even if they conceived the possibility of halting the invaders from a cleft in the face of the earth. It may then be fairly assumed that the trench sprang from necessity, that leaders on both sides, seeking for some protection from concentrated fire, turned to the earth and ordered the burrowing that has changed the whole complexion of war.

Approaching the battle line from a reserve post, the beginning of the trenches appeared as a ditch whose bottom sloped from the surface to a depth of from six to seven feet. Ordinarily there was room for two men to pass in this communicating trench, the sides gradually narrowing as the front lines drew nearer. The entrance was anywhere from two miles to a few hundred yards from the front, according to the nature of the country. In most places there were three lines of battle trenches, the second and third holding reserves, and the first, or fire trench, the men actually on duty. As a whole the trenches follow a tortuous, zigzag course, designed to prevent an enfilading fire if the enemy broke through at one or more points. Frequently a trench section was carried, while an intervening stretch held out until reserves came up and the whole was retaken. Communicating trenches sometimes crossed each other, or several converged at one spot. The system was comparable to the plan

of a city's streets, and the opposing commanders have detailed maps of both their own and the enemy's trenches. Plans of the latter were procured by draftsmen stationed in the first line and by other draftsmen and photographers from the vantage point of aeroplanes. Much time and infinite labor were expended in the work.

In front of the trench line stretched a little wall of earth. At some places, notably in Flanders, sandbags were used. Every few feet was an opening large enough to permit the entrance of a rifle barrel and for the man behind to sight the weapon. Look-outs with periscopes were on duty at regular intervals, the periscopes being one of the war's contributions to the paraphernalia of armies. This instrument consists of a mirror at the end of a tube, which reflects the scenes before it on a second mirror at the opposite end.

Trench walls ordinarily were unsupported, but in some instances it was necessary to use uprights and crosspieces, just as a mine shaft is constructed. In the beginning, life for the men on duty was extremely arduous, but improvement came with experience. Many of the German trenches were lined with concrete, keeping them practically free of water and the earth's moisture. All of the armies learned how to build comfortable dugouts in the trench walls, holding from two to a dozen men. Rude articles of furniture were introduced, with a bed, chairs, and other comforts in many instances. Deserted homes near the front had been shorn of their furnishings to make existence below the ground bearable.

Another variation of the trench was the bomb-proof or bomb pit, which was from ten to twenty feet deep, furnishing secure protection against the liveliest cannonade. When the French broke through in Champagne they found many such bomb pits filled with German soldiers who refused to surrender. Hand grenades were thrown in and their brave occupants blown to bits. One special danger of these pits was the likelihood of a shell's explosion blocking the entrance, bringing death by suffocation.

No sooner had the men become accustomed to trench life than

the fancy of their several races asserted itself. "This way to the Strand," "Piccadilly," "Bond Street," and other similar placards were posted in the British trenches, while particularly comfortable dugouts became the Ritz-Carlton, the Cecil, and so on. The French had their Palais, Faubourg, St. Germain, Champs-Élysée, and the Germans their Wilhelmstrasse. Thus do brave men make light of danger.

As a part of their Champagne offensive the French constructed a number of trenches capable of bringing up artillery and shells by transport. These trenches were in reality sunken roads, six to seven feet wide and proportionately deep. Over them were spread sheets of canvas, the upper surface painted to resemble the surrounding country as a means of deceiving German airmen. The ruse entailed prodigious effort and labor.

The second winter of the war saw vast improvement as regards sanitation and general healthfulness of the trenches. Instead of water knee-deep at many points, the trenches in the west practically were free of that troublesome element. The British and Belgians spent a good part of the first winter pumping water out of their subterranean homes. Frozen feet, neuralgia, and acute rheumatism were common.

What is true of the west largely was true of the east, but the analogy is not perfect. Russians, Austrians, and Germans fought over a vaster sweep of territory, more men have been engaged as a whole, the ebb and flow of battle has covered greater distances. As a result the belligerent forces have contented themselves with a ruder form of trench, made to answer impending attack, with the likelihood of desertion at short notice. Following the stiffening of the Russian resistance after Warsaw's fall and the advent of the second winter, both sides turned their attention to better trenches. The opposing lines in Courland, before Riga and Dvinsk, probably were as well dug in as the armies of the west. And they are almost as close together over a thousand-mile front—that is, from a dozen to several hundred yards. Farther south, toward the Carpathians, in Galicia, Bessarabia, etc., it appeared that the commanders were satisfied to keep an eye on enemy movements from a distance

of several miles. Trenches there were aplenty, but mobile forces rested on towns and villages as basic points and depended upon outposts for warning of an advance.

The Dardanelles campaign saw intensive development of trench warfare. There defender and invader faced each other over a no man's land only yards wide. With the exception of the Sulva Bay and Anzac positions, where the ground sloped gently to the hills above, the Turks had much the better of it. Always in possession of heights which commanded the tip of Gallipoli Peninsula, where Frenchman and Briton made such a bold but fruitless bid for the city of the sultans, they had their foes at an insuperable disadvantage. Being above, they were enabled to observe every move of the enemy and pin him down in such a narrow area that he finally gave up. Trench war on Gallipoli was more like the sieges of old, where foe met foe in hot conflict and died by the sword. Losses on both sides were large.

On other fronts, Mesopotamia, the Caucasus, in Africa, and other outposts, there was little trench fighting. The Italians have had their principal taste of it along the Isonzo, to cross which the Austrians took such heavy toll. Elsewhere the Italians battled almost entirely in mountainous country that precluded extensive trench systems.

CHAPTER CIII

WEAPONS OF TRENCH WARFARE

HOWITZER fire is the chief menace of intrenched troops. These big-mouthed guns, throwing a heavy caliber shell which rises in a high trajectory before dropping to earth, are responsible for a large part of the casualties. By long practice gunners have achieved a weird precision in their deadly business, enabling them to drop howitzer shells with remarkable exactness. The most effective results are obtained by what is termed indirect

fire, guided from an aeroplane. The commander of a battery, protected by a hillock from the view of his opponents, will get the exact location of their trenches when his own airman drops a shower of fine paper above the spot. A minute or two later that particular trench section is subjected to severe shelling. Casualties are inevitable, and if one of the projectiles lands in a trench its defenders are wiped out to a man almost every time. The 9-inch howitzer shell weighs 290 pounds, and the 12-inch 1,000 pounds. These are seldom used except against great fortifications.

Another type of howitzer is the trench mortar. This is a diminutive cannon having a barrel from eighteen to thirty inches long, and usually is placed on the bottom of a trench, its nose pointing toward the enemy at an angle of from sixty to seventy-five degrees. These mortars are fired in much the same manner as ordinary big guns, with the exception that their shells are propelled by powder lighted from a fuse instead of the electric spark that has been adopted wherever possible, owing to the lessening of danger. The mortar shell is very effective. Fired at trenches but a few yards away, it usually reaches the mark. These shells follow the same spiral course as the big howitzer projectiles.

Trench war brought forth many new weapons and reclaimed still others from the past. In this latter class is the grenade, an effective means of attack through the Middle Ages, and even long before, being easily traceable to the custom of throwing Greek fire balls in classic times.

Hand grenades were used to some extent in the Russo-Japanese conflict, but it remained for the European War to see their general revival. Of the many kinds of grenades, both those fired by rifle and thrown by hand, the French bracelet grenade is typical. This is a small shell in reality, perfectly round and filled with bullets on the same principle as shrapnel. At the mouth or neck is a firing pin having a curved end. Into this the thrower inserts another hook on the end of a leather strap that passes around his wrist. He then tosses the bomb toward the enemy, automatically setting off the firing charge by a tug

on the pin. This fuse burns seven seconds. Grenade or bomb throwers become very expert, and all of the armies now have regular corps of grenadiers. About twenty men in each infantry company usually are detailed for this work.

The British employed an egg-shaped bomb containing bullets and charge of trinitro-toluol, one of the most powerful explosives. The thrower unfastens a catch at the instant of releasing the bomb, which in turn releases a trigger that sets off a quick match, burning seven seconds. The Germans and Russians—in fact, all of the belligerents—have bombs of the same general character. Practically all of them depend on the action of the thrower to fire a fuse that burns a few seconds.

In the early days of war beneath the ground the opposing armies were put to it for a method of reaching their foe, the penetration of shrapnel and rifle bullets being insufficient to pierce well-constructed trench barriers of sand in bags or dirt. The men soon hit upon the plan of grenades. They took beef tins and filled them with bullets and a powder charge, to which fuses were attached, and the grenade once more was in vogue. Prompt steps were taken by the army authorities, and the output of grenades now runs into millions.

Supplementing the work of soldiers armed with bombs are the various apparatus for throwing these instruments of death. In this class is the ancient catapult, used since the dawn of time to hurl destruction at a foe. It was once developed to a point where huge stones were thrown several hundred yards into walled cities and against weak spots in barriers. But the modern catapult is of small size, ordinarily nothing more than a resilient piece of wood from three to four feet long. One end being fastened to a heavy timber, the other is bent back so far as possible, and the bomb catapulted from a cup on the unfastened end. The French were partial to this type of bomb thrower, and also have used a contrivance made of metal along the same general lines.

In the British trenches one end of a heavy timber is placed at the bottom of a trench and the other at its top, facing the enemy. A thin strip of metal attached to the timber acts as a spring on which a grenade is placed, the unfastened end being

bent backward until it catches in the notch of an upright stick. Sudden release of this trigger propels the grenade.

The rifle is still another implement employed for bomb throwing. The Germans use this method a great deal, and the French and British to a lesser extent. It is fired by an ordinary rifle cartridge having a slightly smaller charge, and has a range of about four hundred yards.

There are many other sorts of bomb throwers, several of which work on the principle of a boy's sling. Accuracy varies a good deal, and the best results probably are achieved by grenadiers trained in the work. The quasi-mechanical devices naturally have greater range.

Grenades are much employed in a charge, where the thrower has an excellent chance to work havoc in an opposing trench. They also serve to help cut away barbed-wire entanglements before trench lines, although this is chiefly performed by artillery.

Shrapnel is another perpetual threat to the man in the trench. Bursting overhead, these shells throw out 300 bullets each in a fan shape, and when one such shell bursts in the neighborhood of a trench some one is almost certain to be hit. The bullets scatter over a radius of twenty-five yards, and may be fired accurately from a gun 6,000 yards away. To offset this danger the French adopted steel helmets instead of fatigue caps, and the saving in life is said to be considerable. A goodly percentage of shrapnel wounds in the trenches are injuries to the skull, and this new helmet cuts down the number of such wounds in an important way. Shrapnel for the most part bursts in the air but occasionally a lucky shot will place a shell directly in a trench. The result may be imagined.

Both shrapnel and explosive shells, principally lyddite or some of its derivatives, are useful in destroying barbed-wire entanglements, the principal defense of a trench from infantry charge.

A distinctly German weapon, but which was adopted by the British and to some extent the French, is the mine thrower. This projects an iron shell containing more than 100 pounds of explosive from 200 to 400 yards. The mine thrower in reality is another type of the trench mortar and a tremendously effective

one. The results of its fire are terrifying. Like the big German guns that leveled Antwerp's forts, Liege and many other strongholds, it throws a projectile much larger than had ever been used by any army, or was deemed possible at such a range and under such conditions. The effect of a hundred-pound shell falling into a trench from that of the enemy a few hundred yards off is enough to shake the steadiest nerves. So efficient was the weapon deemed that the British hastened to follow suit, and the French also in a more restricted measure.

In addition to all of these dangers the trench mine must not be forgotten. It is a particularly vicious way of killing a man, against which he has no protection once the charge is fired. Engineers on both sides were constantly engaged in driving saps or tunnels beneath the enemy's trench. They were anywhere from a few yards to several hundred feet in length and sloped downward beneath the trench to be blown up. Sometimes detachments, bent on carrying death to trench lines a short distance apart, met underground with only the flicker of a miner's torch to show their enemies. Then a fierce battle ensued, with picks, shovels and strong hands as weapons.

But even more terrible is the explosion of a mine. Every man within the mined area, which might be quite large, usually was killed. More than that, bodies are dismembered—shattered fragments of men, equipment and their trench furnishings mingle in a gruesome heap. Then on comes the enemy, bent upon winning a few feet of ground. If he gains lodgment in the shattered trench artillery opens upon him at once and the inevitable countercharge is not long developing. On many occasions men in the neighboring stretch of trenches forestall the charge of the enemy and meet him halfway. Either method is equally fruitful in casualties.

None of the implements of war, however, is comparable to the machine gun for effectiveness in trench fighting. It is the *ne plus ultra* of destructive machinery. One machine gun is equal to the fire of fifty infantrymen standing shoulder to shoulder. A crew of two men can often hold off a whole company by its deadly action. This the Germans first realized and the whole of their

western front bristles with these guns. Some reports have it that there is a machine gun to every sixth or seventh man, but this probably is exaggerated.

Before the outbreak of hostilities most of the belligerent armies carried six machine guns to a regiment. This number has been trebled at least, and in the front line trenches of the western theatre machine guns are to be met with at every turn of a trench. It is believed that the Germans had a larger number than the Allies.

These machine guns were always ready under all conditions to pour forth their hail of death. Many a charge has been checked at the outset by the concentrated fire of a few such guns. Troops pouring over a parapet who found themselves mowed down by machine-gun fire were more than apt to falter and return to Once in motion the danger of a retreat was less.

Any hint of activity in an opposing trench was sufficient to bring a prompt fire from the machine guns across the way. At night, especially, are they turned loose in a hair-trigger sort of way that tells of constant watchfulness and jumpy nerves. A majority of charges were launched at night, wounded men were carried to the rear, relief came up for weary men on duty, ammunition was moved and all the thousand and one chores of trench life were run. To prevent the enemy from stealing the slightest advantage, opposing trench guardians set off star lights and other aerial illuminations in much the same manner as a Fourth of July celebration. At the beginning the Germans were better equipped in this respect than their foes, but with advancing months all of the armies received plentiful supplies of the kind.

Some of the most dangerous trench work fell to the men told off to repair wire entanglements, build new ones and, in many cases, new trenches. Compelled to work in front of their own lines, with the enemy in easy hearing distance, and with the night made brilliant by fitful illumination, it is a task to upset the most stolid. But this work proceeded every night along the whole front.

Other men also crept from the trenches at night and went

beyond the lines. Their business was to find out what was happening in their neighbor's trench. Great daring and much skill was shown by some of these prowlers, skill which would rival the craft of a plainsman or Indian. They often succeeded in approaching the entanglements of their opponents, and brought back bits of conversation that might enlighten a commander of some important project under way. The number of men equipped for this duty naturally was limited to those able to speak the tongue of whatever race opposed them.

Some sanguinary tales have been told of the East Indian cohorts in the British army who were said to delight in nighttime depredations. These men, brought up in jungle lore, accustomed to go through the world with the soft step and nonchalance that defies the Occidental, found it a delightful enterprise to slip through wire nettings and, with a long knife, descend upon the unlucky Germans whom they could reach. Such sallies were made by one, two, three or a dozen men in a group. Many of them never come back, but they spread terror among the troops facing them, which is a very excellent thing, says the textbook of war.

And the sniper was with the soldier forever. Night and day he kept up an intermittent pot shooting that made every man within range feel he was the immediate target. Officers are the particular fancy of the sniper and a number of high commanders were killed or wounded by sharpshooters. A ruse of the Germans which cost the British many lives was to get a sniper through the lines wearing a British uniform. Then, after dark, he began his work. Stories of the death meted out to such men had a chilling effect on others, and the practice gradually subsided.

Rifle fire, of course, was a great factor either for assault or defense. And all of the armies had long-range rifles of deep penetration. The number of bullets discharged from machine guns and rifles in a critical moment is truly astounding. It is this concentrated fire that prevented a general engagement on the western front and success or defeat for one of the belligerents.

Another development of trench warfare is the buried gun turret. These are built on the plan of ship turrets, with one or two light field pieces inside. Machine guns supplant these in some instances. The top of the turret is about on a level with the trench barrier and is impervious to rifle bullets or shrapnel unless a shell should strike the turret or burst directly above it, when material damage might be inflicted.

Like the mine thrower the trench turret was brought forth by the Germans and was used by them almost exclusively. During the September offensive of the French, a number of such turrets were captured, with the gunners locked inside and chained to their pieces, according to reports. The fire from turrets could be kept up long after men protected only by trenches have been buried with earth or put out of action as a result of heavy artillery fire.

Near St. Quentin, south of Arras, was the famous Labyrinth of the Germans, familiar to the reader of communiqués. This Labyrinth was a perfect network of trenches, with guns at every turn, from the quick-firer to heavy field pieces. It comprised the ruins of two villages, barricaded and fortified to the utmost. A stream cut across the front of it and there was abundant timber. Never before in all likelihood was such a formidable fieldwork constructed. It was laid out with the idea that should the lines on either side be bent back the labyrinth would hold—a thorn in the flesh of the foe. German commanders believed the position to be impregnable.

Several times the French tried to take the Labyrinth. Actions were started with two or three regiments, then a couple of divisions were thrown against it. Outer works were taken but the Labyrinth held. Finally, in the September rush it was swept clean of Germans. The French were amazed at the completeness of detail and ingenuity shown by the engineers who planned the famous Labyrinth. Its fall demonstrated again the old theory that any position can be taken by sufficient masses of troops. If commanders are willing to make the sacrifice any stronghold must succumb, say the authorities.

On the eastern front natural barriers were turned to excellent

advantage by both sides. When the Russians poured into East Prussia immediately after the start of hostilities they carried all before them until Von Hindenburg halted their advance at the Mazurian Lakes. These lakes formed a chain directly in the Russians' path. There was no way to go round. To continue they must go over and accept battle on ground of another's choosing. This they did and were badly handled, estimates of losses running up to a quarter of a million men in killed, wounded and captured. Trenches played a prominent part in the contest, General von Hindenburg having taken every possible precaution against defeat.

Throughout the several campaigns fieldworks have proved superior to strongholds of granite. Przemyśl was taken by the Russians with lighter artillery than that of the fortress. Doggedly the czar's forces pushed trenches forward rod by rod until the city capitulated. This occurred again at Warsaw, where the Germans shattered big forts with their powerful guns, but were held off until the Russians made an orderly retreat, by the men in the trenches. Operations around Riga and Dvinsk also have proved that earth is a better defense against heavy gun fire than masonry. Southwest of Riga, the fine Baltic port of the Russians, lies a stretch of marsh country which the czar's strategists turned to good use. Trenches stopped the Teutons when nothing else had. By maneuvering they were forced to give battle with their flank resting on a marsh, then driven into it and overwhelmed. Seeing Riga slip between their fingers the German leaders dropped back until spring, foiled by trenches, marshes, and the men in the trenches.

The war saw a splendid development of the hospital branch. Wounded men are rushed from the front to base hospitals far distant, with the least possible rough handling, when their wounds permit. Especial pains were taken with regard to men hit in the trenches. No sooner did a man go down than either he or his comrades applied first-aid remedies contained in a package carried by every combatant. He was removed to a trench operating room if the case was urgent, or carried to an ambulance at the end of the communication trenches. Sometimes it was necessary to

wait for nightfall. It is on such occasions that suffering was greatest.

Once in the ambulance the wounded man was on the road to a clean bed, warmth, food, kind hands—all that renders life bearable. Men reached London within less than twenty-four hours after being shot or bayoneted.

There was a complicated system of moving ammunition, food and other supplies to the trenches. Nearly all of this work was done at night under tremendous difficulties. Not only were the transport columns under fire, but they had every conceivable disadvantage to grapple with in the way of bad roads, crowded conditions and the need of haste. Neither motor nor horse-drawn vehicles could approach nearer the front than the communication trenches. From there everything must be carried by hand.

To meet new conditions arising from trench warfare many changes were made in the routine of armies, in the apparel of troops and in the whole working of the men's lines. One of the best remembered complaints that came from the trenches, a humorous incident in a grim chapter, was the request of Highland troops for knitted bands to slip over their knees, such as are commonly worn on the wrist. Highland pride in bare legs was humbled by the mud and wet of Flanders, where rheumatism and other ills quickly developed.

"Fluffies" was a new and affectionate appellation bestowed on the British soldiers by reason of the sheepskin coats, with the fur worn outside, which became part of their equipment. Changes were made in the footwear of all the armies to meet trench conditions. The Germans were better fitted than their enemies in this respect, as in many others, at the start. Boots were part of their regular equipment, while both French and British troops wore shoes only. These were not of the heavy type, especially among the British, but later a shoe was decided upon by the two nations which furnished good protection against water and mud.

Added to the generous amount of heavy clothing furnished men in the field, many millions of dollars were expended by a charitable world in sending mufflers, socks, and other things to

the various armies. Taken as a whole the troops are made as comfortable as the stern enterprise of war will permit. And all of the belligerents showed magnificent spirit in the face of difficulties that were scarcely dreamed of. The first winter of the war saw several million men endure all the hardships of the cave-dweller's day with stoic resolution. The second winter was better—so far as that could be possible.

Front-line trenches usually were manned in six-hour shifts. Men coming on duty spent about six days in the third-line trenches, three in the second, and as many more on the firing line, alternating every few hours between the first and second trenches. This schedule is by no means exact, but furnishes a fair idea of trench routine. After their period of duty the men were relieved of service at the front for a period of one, two, three weeks. Retiring to some near-by village, they found rest and recreation from the strain of war. A portion of their time ordinarily was put in working on the roads and other camp duties, but with sufficient freedom to get a new grip on sorely tried nerves.

One of the most trying ordeals of the war's early days was the lack of facilities for bathing. Like everything else war must be learned and the troops now have many ways of procuring that refinement of man—a bath. Any kind of vat or tub is impressed into service, water being brought from streams. Old mills are in particular favor. At some places water wheels have been rigged up in the open, but this kind of bathing is for fine weather only, it is needless to say. Trench shower baths are obtained by standing under a cask filled with water. The release of a valve gives the bather a good sprinkling.

Life in the trenches furnished an endless panorama of man's adaptability to conditions, of his cheerfulness in the face of trial and the inherent excellence of his heart. Before the war we had been told many times that the race was deteriorating, that we had not the souls nor the wills of those who lived before us. Where, it was asked, were such soldiers as followed Napoleon, Caesar and other great captains, ancient and modern? The answer is before us.

It has been demonstrated that great fortifications, the development of which has occupied engineers for centuries, are not to be compared with earthworks, simple trenches, for defensive purposes. It has been said frequently that Verdun, the stronghold of northern France, was saved from the heavy guns that levelled Maubeuge and other frontier fortresses, not by its size, its artillery or commanding position, but through the countless entanglements and trenches which halted the invader.

Military science in the future will attach small importance to big masonry works. It is probable that elaborate positions comprehending moats, wire entanglements, sunken roads, and buried gun turrets are to succeed the massive fortresses of the recent past and the present. It was shown at Vicksburg so long ago as the Civil War, that guns protected by sand banks, such as the bluffs on which that city stands, could defy artillery fire. The Federal fleet's shelling did little more than toss the sand about, and it was not until mines from the land side blew up the more important works that the city wavered in its brave defense.

Napoleon is said to have been the first great general to employ trenches extensively, although by no means in the same manner as at present. He thought rifle pits a very good thing for troops when besieging a fortress, and had his men dig trenches of a regulation depth on several occasions.

PART XI—POLITICAL HISTORY OF THE WARRING COUNTRIES

CHAPTER CIV

GREAT BRITAIN

WE turn now from the colossal campaigns and battle fields of the Great War to analyze swiftly the political and economic situation that the war created in each of the countries, the financial pressure, the social and business tension, and the general affairs "behind the scenes of government."

Let us first observe the conditions in England on the eve of her peril. When on July 31, 1914, Lombard Street saw the storm approaching it shut the doors of the Royal Stock Exchange and pulled down the blinds to save British credit. But on that day of panic there were at least 40,000,000 Englishmen who did not dream that the war was less than a week away and that it would involve the very life and destiny of the empire. Many of them said complacently: "If Britain must eventually fight, she has her coffers and her navy, and our people can continue to go about their business as usual."

This was the feeling of most Britons even on August 3, 1914, two days after Germany had declared war on Russia, and after it was known that detachments of the German army had entered Luxemburg and were beginning to beat on the gates of Belgium.

As we have seen in Volume I, King Albert's appeal to King George to intervene diplomatically to preserve the neutrality of Belgium was published in the afternoon London papers of August 3, 1914. On the same day Sir Edward Grey, Secretary of Foreign Affairs, spoke in the House of Commons. On August 4, 1914, the

British Government recalled Sir Edward Goschen, the British Ambassador to Germany. France on the same day called on the British Government for its armed intervention to preserve the future equilibrium of Europe. Britain had only 160,000 effective troops that she could throw immediately into the theatre of the war on the continent and she had declared war on the greatest military power in the world. But since Crecy and Agincourt, the English soldier had always ranked among the best fighting men of the world.

The press and the people knew on August 4, 1914, that the nation must have an army on the continental scale as quickly as it could possibly be created. On August 5, 1914, a message was flashed to Lord Kitchener, abroad ship on his way to Egypt and India, calling him back to undertake the gigantic task of making an army in a few months.

The Stock Exchange had been closed on July 31, 1914, as much to save the British credit from the "raids" of foreigners as to prevent Britons themselves from bankrupting their great financial establishment. There is not in the whole history of international finance a more dramatic episode than what had been taking place in Lombard Street during the month of July, 1914. Certain foreign bankers and business men were definitely informed of the immediate imminence of war. On July 14, 1914, it was known to certain foreign bankers that Germany would support Austria if war came as a result of the latter's trouble with Serbia. These bankers made use of their knowledge by unloading millions in pounds sterling in bonds and stocks on the Bank of England and other British banks in exchange for gold. From July 22 to 29, the reserve gold in the Bank of England fell from £40,164,000 to £38,131,000. On July 30, 1914, a further draft of £1,200,000 went abroad, and proportionate amounts were withdrawn from all the other leading British banks. During these same weeks foreign merchants bought unusually large bills of goods from British manufacturers on the usual sixty and ninety days credit and owed for them many millions of pounds.

These so-called "raids" on British finance and industry, it is alleged, had two purposes. If war came it was well known that

France and Russia would certainly fight. But it was hoped that England would remain neutral. From July 31, 1914, to August 4, 1914, not only had Lombard Street suspended business but the whole British financial system was under heavy strain.

On Monday, August 3, 1914, creditors were clamoring for gold for their paper, and there was not gold enough in all the United Kingdom to pay six pence on the pound all around. But fortunately, August 3 was a bank holiday and a run on the banks was avoided. The House of Commons hastened to the rescue by passing an act called the Postponement of Payments, and this gave the government the power to issue a Royal Proclamation postponing the payment of all bills for one month or until September 4, or later. The bank holiday was extended for three more days and the banks remained closed till Friday morning. The government in the meantime began the issuing of legal tender notes for one pound and for ten shillings, which meant that all creditors would be compelled to accept these notes for all debts due them. The moratorium was extended to all debts except for rent for one month and on Friday when the banks opened the panic had passed and business was resumed in the ordinary way. The government had granted the payment of outstanding bills of £400,000,000 exchange, and the Stock Exchange had been saved from disappearing in wholesale bankruptcy.

This panic, however, had not shaken the general stability of British commerce and industry. Only a few industries like the cotton trade had been crippled, others were enormously benefited. In a very short time a sense of security stole over the land. But the government made a move now for which it was severely criticized for some time afterward. This was the purchase of £18,000,000 worth of sugar to save the British market from buying German sugar through neutral markets at German war prices. It was criticized as a blow at British business sagacity, but the war excused it.

When the Expeditionary Force, mobilized on August 5 to 8, 1914, began to land on the latter day on the shores of France, Lord Kitchener called on the British for 100,000 volunteers, and the House of Commons increased the army to 500,000 men and

authorized two war credits, amounting to \$1,025,000,000. To the call for volunteers there was a spontaneous response, but it came largely from certain classes, such as the more skilled and trained workers and the heads of families, men a hundredfold more valuable in the workshop and homes of England at this stage of the great crisis than in the trenches of France and Flanders.

But the Britain entered the war with one signal advantage compared with all of her great struggles of the past. The principal leaders of both the great political parties were quick to see that the empire faced a struggle for its very life. Liberals like Asquith and Grey and Lloyd-George, and conservatives like Bonar-Law and Balfour, stood shoulder to shoulder. The colonies, likewise, quickly proved their loyalty.

In Canada, both conservatives and liberals proclaimed: "There shall be a truce to party strife," and both sides declared that from the Atlantic to the Pacific, "Canada would uphold the honor and traditions of the British Empire." She organized and sent out an Expeditionary Force of 82,000 men, which sailed for England on September 24, 1914. The commonwealth of Australia had 164,631 men under arms and more than half of them had gone to war. These "kangaroos" were the real backbone of the venture that was to be made months later at the Dardanelles. And little New Zealand sent out eight regiments within six weeks time. The great Indian princes offered scores of lacs of rupees and troops for the field.

Lord Kitchener found it a comparatively easy task to get his recruits during the first six or seven weeks of the war, but a lull came. There was a feeling among the trades unions that working-men should not allow themselves to be exploited in war even for the life of the empire itself. Ramsay McDonald and Keir Hardie were the open spokesmen of this feeling, and John Burns, who resigned from the Cabinet on the outbreak of the war, represented the principle of peace at any price.

So the first great task of the war for Britain was to convince all her working people of the needs and responsibilities of the war. The reports of "atrocities," the sinking of British ships by enemy mines, and submarines, and the air and sea raids contrib-

uted something to this education. But the war's needs now called forth a flood of oratory from men like Lloyd-George, Asquith, Bonar-Law, and others. Practically every literary man, poet, and publicist in the kingdom turned his ink battery on the enemy, but this oratory and press bombardment, though much of it was excellent, did not reach the heart of the man in the street, in the shops, in the mines, or on the farms—the men whom Kitchener was trying to get into the army.

The War Office continued to send into service the men that the country most needed at home, and the government did not for a time awake to this fact. The prime minister announced with some pride that 72,000 railroad men had enlisted and he was asked by the "London Times" how the railroads were to transport troops without these men at their posts. The war had not yet touched the imagination of the people, because in the first fortnight the press had been placed under a rigid censorship. The war correspondent had been suppressed, and his stories were not allowed to reach the eyes of the public. The heroism of the British army in saving itself in its retreat from Mons did not get to the public until too long after the event. What was published immediately after this retreat tended to discourage recruiting. What chiefly the British public was allowed to know of the war was the sight of thousands of men in khaki on the streets of all the towns, and military processions headed by brass bands.

On September 4, 1914, an important diplomatic event occurred in London. The Entente Allies—Great Britain, France, and Russia—signed an agreement that no one of them should negotiate a separate peace without the consent of all the others. This agreement was signed at the high tide of German invasion before Paris.

During the first months of the war the fear of spies caused Parliament to pass on August 10, 1914, the Defense of the Realm Act, empowering the king in council to issue regulations authorizing the trial by court-martial and the punishment of all persons contravening military or naval regulations or interfering in any way with the administration of law regulating the course

of the war. Many Germans were mobbed and arrested and the government sent large numbers to the detention camp. Karl Hans Lody, an ex-lieutenant of the German navy, was tried and shot on the charge of espionage, in the Tower. The campaign against resident Germans and naturalized German-Englishmen resulted in the resignation of Prince Louis of Battenburg, a native of Germany, as High Sea Lord at the Admiralty office and Lord Fisher was appointed in his stead.

In September and October, 1914, the extension of German mine fields and the increasing activity of her submarines in destroying British ships agitated public opinion. This did far more for the cause of recruiting than all the fervid oratory of politicians. But not until October 9, 1914, did the country fully realize its peril. On that day the city of Antwerp fell. Mr. Churchill, the first Lord of the Admiralty, had sent 8,000 Royal Marines under Admiral Hood to aid the Belgians in holding that city. The fall of the city not only meant the loss of Belgium to the invaders, but it would give German Zeppelins a base to attack London and other cities.

The fall of Antwerp at once convinced Great Britain that the war must now be a "fight for existence." Lord Kitchener confirmed this view by prophesying in the House of Lords that the war would last three years at least and that the Allies would not begin to fight till the following May.

On November 17, 1914, the Chancellor of the Exchequer, Mr. Lloyd-George, brought into the House his monster war budget. He told the Commons that he was forced to provide for a deficit on March 31, 1915, of £339,571,000, and he argued that a substantial part of this sum must be raised by taxation. He pointed to the precedent of Pitt and Gladstone in raising war funds. This war he said would cost Britain £450,000,000 (\$2,250,000,000) the first full year. If Great Britain rose to the heroic level of 1798 she would be raising a revenue of from £450,000,000 to £700,000,000, and no borrowing would be needed. It would be wisest to assume that the war would be long. It would be folly to borrow to meet interest on loans and loss of revenue. Four-fifths of the money raised would be spent in Great Britain, and

during the war and after reconstruction there would practically be no competition in neutral markets except from America. For four or five years thereafter British industries would be artificially stimulated, but afterward customers' purchasing power would be crippled and much capital would have to be exhausted. During the inflation as much as possible should be raised by taxation. It had been decided to issue a loan of £350,000,000 at $3\frac{1}{4}$ per cent.

A movement for prohibition now passed over England. Lord Kitchener issued an order that the public should not treat soldiers to liquor. The discussion that followed brought out much evidence of discontent on the part of the trades unions.

At the end of the year of 1914 Great Britain had suffered no irretrievable calamity in the war. The nation seemed to be waking up to the great tasks. Unemployment was far less than it had been in times of peace, and pauperism had practically disappeared. A number of new industries had sprung up and capital had taken full advantage of the use of the confiscated German patents.

The set-back to British naval prestige in the destruction of Admiral Cradock's fleet in the Pacific had been fully recovered by Admiral Sturdee's sinking of Von Spee's ships in the Atlantic. Germany had tried to avenge the loss of Von Spee's squadron by shelling the English coast. These naval duels had finally ended triumphantly for Britain in the sinking of the *Blücher* in January, 1915, and in the crippling of other German battle cruisers. In January, 1915, Great Britain had over a million men under arms and a larger army in France than she could supply with ammunition. But she had not as yet fully realized this latter fact. Six months of the war had increased her confidence in ultimate victory.

CHAPTER CV

FRANCE

WE have witnessed the dramatic spectacle on August 3, 1914, at 6 p. m., when Herr von Schoen, the German Ambassador, notified M. Viviani, the French Prime Minister in Paris, that a state of war existed between Germany and France; we have seen how the French Government immediately telegraphed, instructing M. Cambon, the French Ambassador in Berlin, to demand his passports and leave the German capital at once; and we have observed how, on the next morning, the German Ambassador was furnished with a special train, in which he traveled to the German frontier, without an untoward incident. On reaching the frontier he was overheard to confess to a German army officer his great astonishment at the extraordinary calmness of the French people on receiving the declaration of war.

With the exception of a small antiwar demonstration led by Socialists on the night of the 3d of August, 1914, in Paris, there was not a ripple in the calmness of the whole republic, with war now at its very doors. On that memorable evening in the history of France, the Government summoned the Chambers to meet on the next day, Tuesday, August 3, 1914. The sitting was destined to have a decisive influence on the whole course of subsequent events. As the senators and deputies took their seats a profound silence reigned through the Chamber. Everybody seemed to know what everybody else was thinking, and that thinking resolved itself into—"Vive la France!" Socialists and clericals who had long fought one another with the bitterest taunts now shook hands across the aisles. Like magic the German aggression had within days, and even within hours, altered the opinion of the whole populace of France. Every prediction and prophecy that France would collapse when war came was now wholly falsified. Without a dissenting voice the Chambers stood behind the Government.

On August 4, 1914, the French ministry appealed to

Great Britain for her armed intervention in behalf of the future equilibrium of Europe, and, as has been stated, Great Britain gave adhesion to that appeal by declaring war on that same day on Germany. We have seen how on August 1, 1914, Italy had refused to join Austria and Germany in the war. Thus the Triple Alliance, which had existed for more than thirty-five years, fell like a house of cards, and from the Triple Entente, sprang to arms another triple alliance, that was a month later to bind itself hard and fast that no members of it should make peace without the consent of its partners.

France's enemies had counted confidently upon two things: the certainty of internal disturbances and her want of artillery. The internal disturbances did not now, at the supreme psychological moment, materialize. In spite of the activity of German spies the French had under great secrecy and haste manufactured a large number of the 75-millimeter cannon, a light gun, but possessing great mobility, precision and rapidity of fire. The war office believed, and with justification as the war proved, that this gun would in no small degree sustain the morale of the troops.

On August 1, 1914, the day on which Germany dispatched her declaration of war to Russia, France knew that she must enter the struggle, and the War Office gave an order to the Creusot factory for the construction of a number of howitzers. That order went out with the order to mobilize the French army.

The war had come in time to prevent a meeting of international trades unions and socialists in Paris on August 9, 1914, to protest against war. And, too, the Government was able on August 3 to show that it had no connection at all with the assassination of M. Jaurés, the most eloquent of French socialist orators and an uncompromising leader of the antiwar party in France. Jaurés had been assassinated by a lunatic on July 31, 1914.

On August 3, 1914, some changes were made in the French cabinet. It was now one of the most radical governments that had ever ruled France. It had been constructed by leaving out

the two ablest ministers in French public life, M. Theophile Delcassé, who in the Foreign Office had matched German diplomacy in Morocco, and M. Alexander Millerand, a minister with an amazing amount of constructive energy. The majority of Frenchmen felt the Government could not go far in this war without M. Delcassé in the Foreign Office and M. Millerand at the helm of the War Office.

President Poincaré's message and M. Viviani's address to the Chambers on August 4, 1914, came as a bugle blast to the patriotism of the people of France. Not since the Revolution, had Frenchmen's hearts been so stirred by the note of war. The Chambers unanimously passed a number of bills; among them the note issue of the Bank of France was increased from 6,800,000,000 francs to 12,000,000,000 francs; a state of siege was established and a steel muzzle was put on the mouth of the press. The increase in the note issue had given the Bank of France the power to finance the war. The press, after groaning for a day or two under the restraint laid on it by war, gracefully yielded. Another important measure was also passed by the Chambers allowing an exchange of commissioned officers and privates between the territorial and field armies.

The mobilization of the army and its concentration at its allotted posts is described in Volume I. It now proceeded with the greatest energy and facility. The French railroads proved marvels of efficiency in moving the troops. The French war machine was running with ease and speed. On M. Viviani's cabinet table on this same 4th of August, 1914, lay a dispatch that had been sent to the cabinets of London and Petrograd by King Albert of the Belgians, calling upon the three governments to cooperate in defending the neutrality of his kingdom. But the Government and the heads of the army had been woefully deceived in their judgment as to the strength of the fortresses of Liege and Namur. They were still very confident that these Belgian strongholds could hold out till the republic could throw a powerful force into Alsace and Lorraine and draw off the Belgian invaders. This was the keynote of French hopes until August 17, 1914, when the Belgian Government became con-

vinced that Liege could not much longer hold out and on that day moved its archives from Brussels to Antwerp.

On August 10, 1914, the French Government recalled its Ambassador at Vienna, because the Austrian Government had not satisfactorily explained the sending of a number of Slav regiments to the Rhine to attack France. Austria had made this move without declaring war on France, but with the purpose of provoking France to declare war on her, and thus persuade Italy that France was the aggressor and draw Italy, according to her treaty with the Triple Alliance, into war on the side of the Teutonic empires.

On August 26, 1914, rumors began to trickle through to Paris that the Allies were retreating from Mons, Belgium, before the German army. This retreat on Paris by General Joffre produced an immense effect throughout France. Official bulletins gave nothing but curt, ambiguous information and there was none other. The railroads and highways of the whole republic soon became clogged and choked with the vast number of war fugitives attempting to move south, while recruits were being hurried north to help stem the tide of invasion. The people knew nothing but the wildest rumors of disaster, yet they did not lose their heads nor their confidence in Joffre, whose army was being driven back on Paris before an avalanche of spiked helmets.

Even after General Gallieni, the military Governor of Paris, had ordered all the houses in the southern suburbs of the city to be burned on August 29, 1914, and a German aeroplane had dropped bombs on the city on the 20th, the capital was not shaken. General Joffre complained that he was being thwarted in his operations by the war ministry. Premier Viviani now determined to force a change in the Government by resigning from the cabinet himself. He knew that he would be called to form a new ministry, and he was so called. Then the great favorite of the public, M. Delcassé, was called to his old post in the Foreign Office and M. Millerand to the War Office. There was at this time some discussion in the cabinet about throwing Paris open to the Germans, so as to save its buildings and art

treasures from destruction and permit General Gallieni's garrison to join General Joffre's hard-pressed army. But General Gallieni soon announced to the public, in brief but ringing words, that he would stand and do his duty to the end. The new government also made this reassuring announcement. "A conflict is in progress, which, though of supreme importance, is not decisive whatever the issue, the struggle will continue, France is not the easy prey imagined by the insolence of the enemy."

When, on September 3, 1914, Von Kluck's artillery had come almost within range of the fortifications of the city, and some of his horsemen had penetrated within ten miles of the suburbs, the Government moved the capital to safety in Bordeaux. Even in the face of the Government's departure, with the sound of the invaders' guns in their ears, the people of Paris remained doggedly calm, and Joffre was still the country's hero. There is not in all French history another such example of complete unity and calmness under like circumstances, and Paris has felt the hands of the invader more often than any other city in Europe. Moreover, Paris was threatened at the critical stage with starvation, because of the breakdown of the railways. Every noncombatant had been sent out of the city.

But on September 4, 1914, the right wing of the German army turned and marched southeasterly, on September 7 Paris and France learned that their own army had turned to make a stand, and on September 13, 1914, General Joffre announced that the tide had turned and the German army was in full retreat. France was glad, but she did not show it in her old way. She was now too earnest and too determined to waste an ounce of her energy in demonstration.

On September 20, 1914, the Government invited the members of the Chambers to Bordeaux. Two theatres were secured for their meeting, but their presence in Bordeaux soon became a public danger or inconvenience to the Government. Some deputies and senators seized the opportunity to make speeches in which they criticized the Government in its failure to extricate the railroads from their state of demoralization. The suggestion

was made to allow members to explain to the public the causes of the war, but the Government now considered discussion unwise. George Clemenceau, a former Prime Minister, who is in French politics not unlike Mr. Roosevelt in America, opened war in his newspaper on a certain class of young men who through official favoritism had been enabled to escape service in the war. This was in defiance of the censorship, and Clemenceau gave the Government some uneasiness.

When, on September 20, 1914, the German army which had retreated no farther than the Aisne, made its stand in its trenches, the people of France began to accustom themselves to the idea that the conflict would last much longer than that of 1870. Patience and firmness were the great qualities now exhibited, and never did the French people have need for these qualities more than now. The railroads continued so swamped that many communities were suffering for food. In this situation the hardest difficulties fell to M. Ribot, Minister of Finance. He had to find the means, not only to feed the army and the civil population, but to give work to the unemployed. The Government now decided that the state should make itself responsible for the support of the families dependent on the bread winners, and that the municipalities aided by the state and the departmental authorities should provide subsidies by gifts in money, food, fuel, and clothing for the unemployed. Great aid was given in this work by the Bank of France.

The task of M. Briand, the War Minister, was as great as that of M. Ribot. In the beginning of the war the French Government and munition industries had no conception of the immense quantities of ammunition and war material that would be consumed on the battle fields. M. Briand grappled with this difficulty and hurried the manufacture of heavy guns with amazing energy.

By September 25, 1914, when the army had begun to intrench in earnest in northern France, the supply service had become a model. The Government then commenced the publication of an army bulletin to give such news as would buoy the hopes and spirits of the soldiers. This bulletin published the statement that the superiority of artillery passed to the Allies with the

battle of Aisne. The war had now become one of attrition on both sides, and the French were exhorted to cultivate patience and endurance and fortitude.

On October 3, 1914, the Minister of Finance announced that advances made to the Government amounted to \$420,000,000. He also stated that business was beginning to show a slight improvement. Great improvement had been effected in the management of the railways. From October 1 expresses were resumed on all the lines. On October 7 an official French statement put the number of German soldiers on that date in France and Belgium at 1,640,000.

On November 1, 1914, the continued depression in exchange stopped, and imports and exports again increased. On December 7, 1914, the Paris Bourse, which had been closed on September 3, was reopened for cash transactions. The 3 per cent route opened at only 72.50, while before closing it remained firm at 75, but this latter price was due to the fact that the syndicate of agents of change had forbidden dealings of a lower figure. The market was not swamped as had been feared by offering of enormous masses of securities. The provincial bonuses had remained open all along and had absorbed many of these securities.

On December 8, 1914, the Government returned to Paris. On December 22 the Chambers met, and the unity that characterized the meeting on the outbreak of the war still endured in all its strength. On this day, General Joffre, who had practically become the dictator of the army, announced that twenty-four generals had been retired. In Paris it was called "weeding out inefficiency" in the army. The Chambers voted a war credit of \$1,100,000,000.

The year of 1914 closed with France proclaiming her faith in ultimate victory. The only notable moral and economic event that occurred in the republic during January was the Government's prohibiting the sale of absinthe. The bill was signed by President Poincaré on January 7, 1915.

CHAPTER CVI

GERMANY

THE economic stability of Germany is one of the most remarkable features of the Great War. We have witnessed the spectacle of Emperor William suddenly returning to Berlin from a yachting cruise in the Baltic on July 26, 1914; we have heard his words on July 27, when Germany declined to accept the British proposal for a conference on the ground that it would practically amount to a court of arbitration, "that if Russia mobilized only in the south, Germany would not mobilize, but if she mobilized in the north, Germany would have to do so too." The emperor further stated that he was doing his best at Vienna and St. Petersburg to get the two Governments to agree. We have seen how, on July 31, 1914, Germany began mobilizing, when on the same day Russia issued orders to mobilize, and how on August 1, 1914, Germany declared war on Russia, and the Great War became a fact. We have further observed how on August 2, 1914, German troops entered the Duchy of Luxemburg and demanded to know whether Belgium would permit the free passage of troops across Belgian territory; how Belgium refused permission and declared that she would defend her neutrality; and how Germany then informed Belgium that she would carry out by force her plans to approach the French frontier through Belgian territory, and German troops entered Belgium at Verviers.

In Volume I we learned that on August 4, 1914, the British Ambassador handed to the German Minister of Foreign Affairs, Great Britain's declaration of war on Germany for violating the neutrality of Belgium, and how on that same evening occurred the celebrated interview between the German Chancellor and the British Ambassador, in which the latter was told that Great Britain would draw her sword on Germany over a "scrap of paper," referring to the Belgian treaty. To give a superdramatic dénouement to the dark hours of August 4, a Berlin mob attacked the British Embassy, broke the windows

and wrecked the furniture when it had learned that Great Britain had declared war on Germany. We have further seen how on the following morning, August 5, 1914, the British Ambassador, about to take his departure from Berlin, was handed the following note by an aide-de-camp from the kaiser:

"The emperor has charged me to express to your excellency his regret for the occurrences of last night, but to tell you at the same time that you will gather from those occurrences an idea of the feeling of his people respecting the action of Great Britain in joining with other nations against her old allies of Waterloo. His majesty also begs that you will tell the king that he has been proud of the titles of British field marshal and British admiral, but that in consequence of what has occurred, he must now at once divest himself of those titles."

The first political events after the beginning of the war occurred two weeks later when a German "White Paper" was issued by the Government under the title, "How the Franco-German Conflict Could Have Been Avoided." It was published only in England, and among other dispatches was one from Emperor William to King George, with reference to a suggestion by the German Ambassador in London, that Germany might refrain from attacking France in a war between Germany and Russia, if France remained neutral, that on "technical grounds this suggestion could not be accepted, as the German mobilization, which had been proclaimed that afternoon (August 1, 1914), must proceed against the two fronts, east and west, as prepared, and cannot be countermanded," but that if France should offer her neutrality, "which must be guaranteed by the British fleet and army," he would refrain from attacking France and employ his troops elsewhere." It was afterward explained that the Franco-Russian alliance bound France to support Russia in such a war.

The domestic political history of Germany was scarcely less vital to the crisis than her diplomatic history. On August 1, 2, and 3, 1914, the imperial chancellor was absorbed in delicate negotiations with the leaders of various Reichstag parties anticipatory of the famous war session of August 4, 1914, held under the presidency of the emperor in his palace. It was

of the utmost political importance for Germany's swift success in the war—and she then counted on no other—that a picture of unalloyed harmony should be presented to the world. The Socialist leaders demanded, in accordance with their party tenets, evidence that the hostilities for which the Government required £265,000,000 sterling of emergency war credits and £75,000,000 sterling of loans authorized, were of a "defensive" character.

The "proofs" were furnished. The "sword had been forced into the emperor's hand" by Russia and France. Germany found herself in a "state of necessity which knows no law." The Fatherland was in imminent "peril." Invasion was at its door—all its doors. The Socialists yielded. The parliamentary group in solemn council assembled, voted by a practically unanimous ballot to rally around the flag with the rest of the nation. Herr Haase, Bebel's successor, stood up in his place in the House on the fateful afternoon of August 4, 1914, and amid protestations of social democracy's "constitutional abhorrence" of war, militarism and aggression, pledged his party's 111 votes to the measures for which the kaiser's Government needed parliamentary sanction. Ten minutes later Haase's followers were on their feet, shouting with the rest of the Reichstag the chancellor's sentiment, issued in defiance at England, France, and Russia, that a united Germany ("Ja daz ganze Volk") an entire people was now in the field. So Germany went to war with every man, woman, and child of her 67,000,000 population heart and soul in the struggle. The great masses of the nation flung themselves into the conflict with the grim determination that they must "win or die."

Not only had Germany been made politically solid for the war, but she instantly began to demonstrate another phase of her capacity that was to startle the world. We have seen that Great Britain in the first stage of the war actually turned from the war itself to pick up Germany's lost foreign commerce. But this commerce was now taken from Germany as a great burden is taken from the back of a runner. It was a handicap to her in war, and for the time being she was well rid of it. In a flash, she reversed the machinery of her industrial, economic, and civic life, and hitched it up to her giant war machine. Every man to every

machine in the empire had their gauge standard. By simply throwing a belt, the power that was making goods for the South American and Asiatic markets was switched on the manufacturing of guns and shrapnel for the battle fields of France and Flanders.

The German Government on August 9, 1914, again approached the Belgian Government, renewing the demand on the "ground of military necessity" that German troops be allowed to pass through Belgium. Some of the outer fortifications of Liege were then in ruins. The Germans now occupied the city and agreed that the Belgians could now peacefully yield and retire with their Government to Antwerp after having shown such "splendid heroism." The request was again flatly refused.

The German Imperial Bank announced on August 10, 1914, that it held £65,000,000 in gold. With the outbreak of the war, gold had been called in as a prime defensive necessity of the realm. The newspapers organized gold collecting bureaus, and daily preached the necessity of paying gold into the bank. Before the war was a week old all gold disappeared. Notes for even as low as one mark and two marks were issued, and the man who brought to the bank a 10-mark piece in gold and took paper for it was called a true patriot.

On August 1, 1914, the Italian Government had intimated clearly that it would not join its Teutonic allies of the Triple Alliance in the war. On August 7 the German and Austrian Governments renewed pressure on Italy for assistance in the war, promising, it was reported from Rome, territorial compensation.

Germany masterfully coordinated her industries with her war machine. On August 12, 1914, Dr. Walther Rothenman, son of the founder and head of the famous Allgemience Electricitats Gesellschaft (General Electric Company), was put in charge of a department of conservation. It was Rothenman's primary task to conserve all existing supplies of raw material essential to the prosecution of the war, copper, cotton, brass, steel, iron, coal, petroleum, etc., and to arrange for their replenishment on the largest scale possible. To do this work he was appointed by the Government over what was called a "raw material division,"

which was added to the War Ministry. The Government at this time began to link up with the great Krupp gun factory every industry that could increase the output. The great chemical industry was at once included in this organization.

With the passing of the first fortnight of the war, 100,000 women had been called to take the place of men on street-car lines, railroads, and in many clerical departments of the Government where men had served.

The American Ambassador asked the German Chancellor on September 5, 1914, if the German Emperor would be willing to discuss terms of peace. The chancellor had then just heard the report that the Triple Entente had signed a compact not to make peace separately, and he replied that in view of this compact in which the Allies had agreed not to cease hostilities except by common consent, the inquiry should be addressed to them. "There were," the chancellor continued, "three requisites to Germany's peace negotiation: First, England should forego her demands for a war to the finish and the complete crushing of Germany; second, while negotiations might be considered in regard to the German colonies, the German Empire in Europe must remain intact; and third, that Germany should be secured from her neighbors around her.

These statements were later explained by Dr. Dernburg in New York. He said that Germany would not consider it wise to take any European territory, but would make "minor corrections of frontiers by occupying such territory as has proven a weak spot in the German armor." Belgium, which belonged geographically to the German Empire, would be incorporated in the custom's union like Luxemburg, but her neutrality having been proven an impossibility, would be abolished, and her harbors secured for all time against British and French invasion. Great Britain, having bottled up the North Sea, a more liberum must be established, and the channel coasts of Holland, England, and Belgium must be neutralized, and in view of Germany's growing population she should have Morocco. Germany must have a recognized commercial sphere from the Persian Gulf to the Dardanelles. Egypt, if she desired, should be returned to Turkey.

Dr. Helfferich, the Chancellor of the Exchequer, announced on September 15, 1914, that a war loan of £200,000,000 at 5 per cent would be floated, the issue price being 97½. Great efforts were made to secure the success of this loan, and within a few days the total subscribed amounted to £223,000,000, but only £188,000,000 of this had been paid in at the end of November, 1914.

The enormous increase in armaments caused the Krupp works to increase their capital stock from £8,000,000 to £12,000,000 on September 20, 1914. Germany now confiscated all capital held by Russia, France, Belgium, and England in the empire, and any repayment of this capital was declared to be an act of high treason.

In reply to the alleged "atrocities" in Belgium, the German Humanity League issued on September 20, 1914, from Rotterdam an appeal to the "civilized world," concluding as follows:

"No matter how long the campaign and the sacrifices it may entail, we know that the true and lasting interests of the toilers and wage earners in Germany can only be served by the victory of the allied armies. The kaiser having deceived and ruined innocent Belgium, is now despoiling and drenching France with the blood of his victims. It must, therefore, be plain to all honest men, without distinction of race or creed or party, that there can be no settlement of the existing conditions, no lasting peace or security for the rights of man, no protection of democracy from brigandage and death, until the imperial domination of Prussia with Germany is crushed, disarmed, and swept away forever. Then and then only, will Bavaria, Württemberg, Saxony, and Hanover be rescued and Poland liberated from the grip of a monarch, who by his conduct had forfeited the allegiance of his subjects, and by his boastful defiance of international treaties and conventions has embarked upon a career of crime unparalleled in ancient or modern times."

On October 13, 1914, the German Government after the fall of Antwerp gave assurances to Holland that it would respect the neutrality of the Scheldt River leading from Antwerp through Holland to the North Sea. During the siege of Antwerp there was great uneasiness in Government circles at The Hague that

Germany would seize the mouth of the Scheldt to use in bringing her submarines and other warships nearer to England on the ground of "military necessity," her excuse for invading Belgium.

On October 17, 1914, Germany estimated the number of prisoners she had taken in the two months of the war up to the first of October as 8,800 British, 31,000 Belgians, 94,100 Russians, and 123,000 French. Many of these prisoners had been put to work harvesting the German crops, but a few weeks later through the medium of the American Ambassadors in London and Berlin all British prisoners of war who were adjudged of no further use for military services were exchanged.

The Prussian Diet at the opening session on October 22, 1914, voted another credit of £75,000,000. This made £275,000,000 pounds now appropriated to the needs of the war in its third month.

The kaiser on October 24, 1914, made a change in the Chief of the General Staff by appointing the German Minister of War, General von Falkenhayn, in place of Field Marshal Count von Moltke. The reason for Von Moltke's resignation is said to have been his radical differences with the emperor over the campaign in France. Von Moltke's plan was to concentrate all efforts to break through the French lines at Verdun and to force the British to retire in a northerly direction. The kaiser wished to reach Calais and Dixmude, and Ypres on the Yser was the result. An official German casualty list on November 4, 1914, according to a Danish statement, totaled 412,000 for three months of the war.

Attention is drawn to the fact that on December 1, 1914, the rulers of five warring nations were on the battle lines; King George, King Albert, and President Poincaré were in northern France and Belgium, and Emperor William and Czar Nicholas were at the eastern front. On this occasion Emperor William as the head of a state is reported to have said to a deputation of his soldiers in Poland: "We shall continue to fight successfully as hitherto, for Heaven is on our side. With God's help we shall win a long peace, for our nerves are stronger than those of our enemy."

In both the German and Prussian Parliaments, December 2, 1914, all parties united in declaring that the war should be prosecuted to a successful end. In the German Parliament, the Imperial Chancellor, dressed in the gray service uniform of a general with a sword at his side, declared that the German nation was fighting "a defensive war for right and freedom," and that though the apparent responsibility of the war fell on Russia, the real responsibility fell on the British Government, as the latter would have made the war impossible, "if it had without ambiguity declared at Petrograd that Great Britain would not allow a continental war to develop from the Austro-Serbian conflict. Such a declaration would have obliged France to take energetic measures to restrain Russia from undertaking warlike operations, and the German action as mediator between Petrograd and Vienna would have been successful. But Great Britain did not act thus. Great Britain was aware of these political overtures of the powerful group around the czar. She saw how the ball was rolling, but placed no obstacle in its path. In spite of all of its assurances of peace, London informed Petrograd that Great Britain was on the side of France, and consequently on the side of Russia. The Cabinet of Russia allowed this world-wide war to come about, hoping with the help of the Entente to destroy the vitality of England's greatest European competitor on the markets of the world. Therefore, England and Russia before God and men bear the responsibility for the catastrophe which has fallen upon Europe. Belgian neutrality which England pretended to defend was nothing but a disgrace. On the evening of August 2, 1914, we informed Brussels that we were obliged in the interest of self-defense, and in consequence of the war plans of France which were known to us, to march through Belgium, but already on the same day (August 2) before any of our demands in Brussels could have been known in London, the British Government promised France unconditional assistance in case the German fleet should attack the French coast. Nothing was said about Belgian neutrality. How can England maintain that she drew the sword because we violated Belgian neutrality? When on August 4 I spoke of the wrong which we were committing with our march

through Belgium, it was not yet established whether the Belgian Government at the last hour would not desire to spare the country and retire under protest to Antwerp."

On December 2, 1914, the German Government sent Prince von Bülow to Rome to induce Italy to remain neutral. There was at the time a strong war party in the Italian Parliament, and a large section of the people agitating for war with Austria.

On January 26, 1915, the German Government ordered the seizure on February 1 of all stocks of corn, wheat, and flour, and forbade business transactions in these commodities. A Government distributing office was established.

CHAPTER CVII

RUSSIA—AUSTRIA—BELGIUM—TURKEY

TURNING now to Russia we find a remarkable situation. On August 1, 1914, when the tocsin sounded throughout the empire, the order went forth to close every vodka shop that had remained opened, at railway stations and at hotels and restaurants, and to seal up all private brandy cellars. For many years the manufacture of vodka had been a Russian state monopoly, the revenue from this source alone amounting to \$500,000,000 annually, but in the previous April the czar had instructed the head of the treasury to discontinue the manufacture of this Russian brandy, so that the Government might find a way to "tax the toil of the people instead of taxing their drunkenness." At the outbreak of war the Minister of Finance estimated that the people within that short time have increased their savings on an average of \$15,000,000 per month, as shown by the deposits in savings banks and other investments. He estimated that what the people would now save from temperance would pay Russia's bill in the war.

The closing of the vodka shop was to become an unusual factor, a military factor of great importance for Russia and her allies in

the war. The minister of war estimated that because of prohibition the Russian army was mobilized and thrown on the Polish-German frontier three weeks earlier than it would have been possible with the vodka shops open. Prohibition in Russia, he contended, saved Paris and the Allies in France by Russia's reaching the battle field in unexpected time. He declared, "with the war and without vodka Russia was to find herself more efficient and prosperous than with vodka without the war." The Russian people, now estimated at 170,000,000, had for years been spending \$15,000,000 daily for drink. The war had smashed the last brandy glass on the bar and shut the doors. The czar had solemnly affirmed, with his empire on the march, that never another drop of vodka would again be legally sold in Russia. That is the astounding social transformation brought about on the outbreak of the war.

Russia's first move on the chessboard of strategy was on August 22, 1914. The czar issued an order dismissing all Austrian and German colonelships in Russian regiments, and depriving them of Russian decorations. This was never done in any previous war. Russian officers were also forbidden to wear German decorations. These extreme measures were decided upon at a special council held at Moscow as a response to the alleged inhuman treatment of Russian subjects by Germans and Austrians, and the indignities inflicted on the Imperial Russian family. The ostracism excluded the possibility of eventual dealings between the Russian Imperial House and the German and Austrian royalties.

The next remarkable occurrence in Russian politics was geographical. This was a world-wide declaration on September 1, 1914, that St. Petersburg was no more. An imperial decree made it known that in future the Russian capital was to be called Petrograd. This change had been contemplated for some time. The German-sounding name of the city had long been a strange anomaly, and with the outbreak of the war there had been a widespread demand that it be altered. The name applied to the capital in the change was used in the writing of Pushkin and Tolstoy and other famous Russian authors.

The Jewish question now arose. The Russian Minister of War on September 5, 1914, issued an order permitting Jews to become officers in the Russian army and navy, and the announcement was well received in all quarters. Up to that time no Jew was ever allowed to become a military or naval officer, and the decision to admit Jews to such positions was said to be due to the gallantry which the Jews as common soldiers had displayed in the battles already fought. The imperial decree enabled the Russian commander in chief to confer commissions on several hundred Jews who gained exceptional distinction in the battles which preceded the capture of Lemberg. When this announcement was made it was also stated that the civil law restrictions on all members of the Hebrew race would be removed. The Jews would be admitted to the full rights of Russian citizens. Those Russian papers which had formerly been relentless advocates of antisemitism not only refrained from raising any objections, but expressed their approval of it in the warmest terms. The same feeling prevailed in those circles of Russian society in which it was formerly a breach of etiquette to mention the name of a Jew.

The war did not find Russia unprepared in regard to finance. The free balance in the state treasury amounted to more than \$250,000,000, while the gold reserve in the state bank was more than \$85,000,000. Economies in expenditure for the current year of 1914 had amounted to a saving of \$160,000,000, while the surplus for the first half of 1914 was \$38,000,000. In fact, so flourishing were the conditions that more than \$500,000,000 were at the disposal of the Government to carry on the war without it being necessary at the outset to impose additional taxation. But on September 8, 1914, the Government levied new taxes on the people, and on September 28 Petrograd bankers placed at the czar's disposal \$500,000,000, for financing the war and for the benefit of the families of soldiers. The next day the moratorium on all debts was extended another month.

The Polish problem next demanded decisive action. The czar on August 15, 1914, issued through the Grand Duke Nicholas, the commander of the Russian army, an address to the Poles. The war was the first that had ever occurred between Russia and

Germany and Austria since Poland had been divided among them at the Vienna Congress. It was of the utmost importance to Russia that she command the allegiance of as many of the Poles as possible, as she now was in possession of the main part of Poland and its capital, Warsaw. The grand duke's words to the Poles on this occasion, as his army entered Warsaw, were as follows:

"The hour has sounded when the sacred dream of your fathers and grandfathers may be realized. A century and a half has passed since the living body of Poland was torn to pieces, but the soul of the country is not dead. It continues to live, inspired by the hope that there will come for the Polish people an hour of resurrection and fraternal reconciliation with great Russia. The Russian army brings you the solemn news of this reconciliation, which obliterates lines dividing the Polish people, which it united conjointly under the scepter of the Russian Czar; under this scepter Poland will be born again, free in her religion and her language. Russian autonomy only expects from you the same respect for the rights of those nationalities to which history has bound you."

The sentiment of this address inspired the Poles. They appointed a committee, which met in Warsaw on November 28, 1914. There were present on this occasion all the Polish members of the Russian Duma and of the Council of the Empire, and all the Polish members of the preceding Dumas, as well as a considerable number of representatives of various political parties and eminent workers in the national field. The committee adopted the name of the Polish National Council. The slogan of this convention was the union of the Polish territories into one whole, with the future political development of Poland on the basis of complete self-government. A manifesto was issued to the whole nation which read in part as follows:

"The Polish nation in these times is contributing with its entire force and power to the giving of a victory over the Germans. Notwithstanding that the war has fallen on our country with a hurricane of misfortune and destruction; notwithstanding that it has brought us ruin, a complete devastation—we yet endure

these calamities calmly and with perfect serenity of spirit, confident in a bright to-morrow.

"The Russian army has already set its foot on Polish territory in Austria. We now expect that it will enter the part of our nation that is possessed at present by the Prussians. In this far-reaching moment for our nation there stands before our countrymen in those parts of the territories of Poland the solemn duty to show in thought and deed that they unite in aims with the rest of the nation in Poland."

That the Poles desired the complete conquest of the Germans was owing to their belief that the Allies, with victory, would unite the territories of the former Polish republic into an independent political state, since it would not lie in the interest of England or France or other states for Russia to increase her power. Moreover, they believed that Russia, though victorious, would so enfeeble her forces that she would not seek a quarrel with united Poland. Russia had at last recognized her error and injustice to Poland. This was said to be the feeling of a great majority of the Poles at that time, and Russia did not interfere with its free expression.

On October 29, 1914, an order was issued expelling all Germans and Austrians from Petrograd within two weeks. On the next day the Russian Government deprived all German and Austrian subjects of their right in immovable property either leased or freehold, situated in rural districts near the Russian land frontier, the Baltic, the Black Sea, or the Sea of Azoff.

On November 1, 1914, the Minister of Finance announced the issue of an internal loan of \$250,000,000 for flotation. This was the first real loan floated for the war, and in ten days the loan was oversubscribed by several million dollars.

On November 3, 1914, the czar renewed his pledge to his allies "to see the war through to victory." This assurance was provoked on account of rumors that Russia wished to make peace.

The Minister of Finance on November 7, 1914, proposed a levy of \$42,500,000 by increasing the income tax. This increase was to be realized by imposing on all incomes exceeding 1,000 rubles (\$300) at the rate of 16 rubles up to 15,600 rubles for incomes

exceeding 190,000 rubles, together with a tax on men exempt from military service.

Russia, the greatest lumber country in the world, placed an embargo on all exports of lumber on November 13, 1914. This move was to cut off shipments to Sweden and thence to Germany of certain kinds of oak and walnut and hickory, for which there was a great demand in the Teuton empires.

Absolute prohibition went into effect all over the empire on November 15, 1914. Heretofore only the sale of vodka (Russian brandy) had been forbidden, but now wine and beer were added to the list, and the application of this law was extended to all the conquered territories. In Lemberg a restaurant keeper was fined for selling a drink of wine to a Russian trooper.

The Government on November 17, 1914, forbade the export of copper, brass, iron, steel, and lead, all metals now growing in demand in the enemy countries.

The social revolution in Russia was as important as its military developments. Within the first three months of the war, the teaching of temperance had been instituted in most of the Russian schools and in the churches. Books and charts and elaborate diagrams had been prepared for this purpose, and the clergy had not only delivered many temperance addresses and sermons, but had issued tracts and pictures to instruct the people. In all this teaching, the chief note was that war had taught Russia the absolute necessity of temperance if she hoped to win.

The czar had launched another great reform for the improvement of the Russian people in instituting in his Government a department to propagate the science and art of physical culture. The war had demonstrated that Russians did not possess that perfect control and agility of body shown in the other European races. Russia never had any system of athletics and outdoor sports. Her people had never cared for athletic sports in the western European sense, and the soldiers, though having great strength, were awkward and lumbering in movement. In November, 1914, this reform was set in motion in the schools, on the drill grounds, and in the villages throughout the empire.

One of the strongest factors deciding the czar to make war had

been the feeling of the orthodox Russian Church. It was imbued with the idea that the war was "holy," and on September 10, 1914, and at the end of the year, the church sanctified the war against Germany.

On December 2, 1914, Russia took possession of all enterprises conducted by hostiles, and on December 9 the Minister of Finance announced that the war had cost Russia for the first three and one-half months \$892,500,000.

Although the Government was receiving the most hearty support of the people in the war, yet the first six months was marked in Russia by a struggle between the bureaucracy and the popular will. In December, 1914, there was actually less harmony between these two forces than at any time since the suppression of the revolution. The people were more and more asserting themselves in emphatic demands for greater liberty.

The Duma voted three milliards of rubles for the war, but before doing so the deputies wanted to know what the Government would give the people in return. The Government at first declared that it would do nothing at all, that it would follow the same policy in the future as in the past. Then the significant thing happened which showed that the spirit of rebellion was again active against despotism in Russia. The peoples' representatives raised such a storm of protest that to placate them the Government was compelled to modify its uncompromising attitude, and to yield to the extent of making some vague promises. The Government declared that it did not wish to deprive Germany of any of her territory. It wanted nothing but Galicia and the Dardanelles. The Constitutional Democratic Deputies insisted mainly upon the Dardanelles.

In the second sitting, when it came to the question of reforms, Malakov, the Minister of the Interior, declared that the Government would make no concession. It would pursue the same course as heretofore. His speech produced a scene of the greatest disorder in the house. The deputies jumped from their seats, and the president was obliged to declare a recess. When the Duma reassembled, Goremykin made a statement somewhat softening the harsh impression created by Malakov's blunt refusal to con-

sider the demands of the deputies for a freer Russia generally, for better treatment of Finland, and for granting equal rights to the Jews and stopping Jewish persecution.

On July 27, 1914, the Vienna and Budapest bourses, feeling the tremor of war in the atmosphere, closed their doors just as London, Paris, and Berlin were to do three days later. We have seen how on August 12, 1914, Austria declared war on Great Britain and withdrew her troops from the borders of France, whence she had sent them to provoke France to declare war on her in order to prove to Italy, one of her Triple Alliance partners, that France was the aggressor, and how France accommodated her by declaring war on her that same day.

But Austria was not neglecting to watch Italy, for on that same day—August 12, 1914—she sent one of her ablest diplomats, Barn Karl von Machio, to Rome. One month and seven days later—September 19, 1914—Austria sent a force of 300,000 men to guard the frontiers between herself and Italy. In the first two weeks of August there had been a number of energetic nationalist demonstrations in Rome, Milan, and other Italian cities. Every ingenuity of statecraft, and even of menace, was employed to keep Italy neutral and passive while the Dual Monarchy hurled her mixed legions on Russia and little Serbia.

But Austria now not only had war with all the humiliation and bitterness of defeat in Galicia and even in Serbia, but with it she had to content with pestilence. Cholera broke out in a number of her cities, and September 24, 1914, more than fifty cases were reported in Budapest, in Vienna, and in Galicia.

On September 10, 1914, Vienna voted \$200,000 to fight cholera. The whole monarchy was more alarmed at the possibility of the spread of the plague than of the invasion of Russia.

On October 10, 1914, actual famine threatened many of the poor of her cities. The price of bread had risen so high that after repeated efforts of the Austrian Government, it had on that day persuaded the Hungarian cabinet to consent to a suspension of the import duties on grain. But as a partial concession to the Hungarian agrarian interests, it was understood that the Government would attempt to fix any scale of maximum prices for the

grain market. The spirit manufacturers had been forbidden to use corn and potatoes, and they were therefore forced to use sugar beets and molasses for substitutes. It was hoped that these measures would tend to prevent a tendency to a further advance in the price of breadstuffs. As the result of the closing of many refineries in Galicia since the Russian occupation, petroleum and benzine had become very scarce, and the prices had more than doubled since the end of July. Candles had suddenly found a demand, at rising prices, in the homes of people of moderate means.

The fall of Lemberg was a terrible blow to Austrian prestige. Much discontent was expressed in Vienna because Germany, in protecting her own interests in East Prussia against the Russians, had neglected her ally. Count Tisza, the Hungarian Premier, visited German headquarters in the east in November, 1914, and as a result a large force of Germans were sent to join the Austrians in Serbia.

Austria's foreign trade had been nearly wiped out by the war. At the end of the fiscal year of 1914 there was reported on November 10 a deficit of \$168,000,000 in exports. Her great drug trade with western Europe and America was a severe loss to her, for in some of these drugs she possessed a valuable monopoly which the war was to take from her by compelling other countries to produce their own drugs similar to her or substitutes.

On October 26, 1914, the world was reminded of the event that occasioned the war by the placing on trial at Sarajevo, Bosnia, the assassins of the Austrian Archduke Francis Ferdinand and his wife. The trial ended in a verdict of guilty.

The world was again to be reminded of the occasion of the war and its agents in the resignation of Count Leopold von Berchtold, the Austrian Foreign Minister and the author of the ultimatum to Serbia, on January 13, 1915. Count Burian was appointed in his stead, and the change was hailed by many Austrians as a good augury for Austrian diplomacy.

The final result of the subscription to the Austrian war loan, it was officially announced on January 23, 1915, amounted to

\$670,000,000. Of this sum, Austria contributed \$433,000,000, and Hungary \$237,000,000.

The mobilization on January 28, 1915, provoked violent uprisings among the south Slavs. A number of civilians were killed in the province of Bosnia and Herzegovina. The Slav troops were sent to the Italian frontier, while the Italian troops from Trieste and Trent were sent to Galicia.

The tragedy of Belgium during the first six months of the war was offset only by its fortitude. King Albert told the Belgian Parliament on August 4, 1914, that a nation which defends itself commands the respect of all. Such a nation cannot perish. He urged a united and stubborn resistance to German invasion. This speech was in reply to the German invasion of Belgian territory at Verviers on August 3, 1914. The complete political union of Belgium was marked on August 4 by the appointment of M. Vandervelde, the Socialist leader, to be a minister of state.

By August 8, 1914, the Belgian resistance to the German attacks on Liege had amazed the whole world. The Germans had not expected such opposition, they had come without adequate supplies, and were otherwise unprepared for it. On August 9 they appealed to King Albert, through the Netherlands Government, urging him to allow them to spare Belgium, after her heroic resistance, further suffering. They declared themselves ready for any compact with Belgium compatible with their conflict with France. The king turned a face of flint to the German proposal.

When on August 17, 1914, it was seen that the Belgian frontier fortifications could not withstand the German assaults, the Belgian Government was removed from Brussels to Antwerp. On August 20 the burgomaster of Brussels, M. Max, issued a proclamation warning the people of the city against panic, advising them to give no information to the invaders, and promising that he, as burgomaster, would stand by them. The Germans were now at the gates of the city. M. Max met them and declared that the city was undefended. They imposed a levy of 200,000,000 francs (\$40,000,000) on it, and 450,000,000 francs (\$90,000,000) on the province of Brabant. On August 23 the Belgium Exchequer was

permitted to draw on a loan from England and France of \$100,000,000 to enable it to meet the demands of Germany.

The political history of Belgium during this period is tragic. From the date of the Germans taking possession of Brussels till the fall of Antwerp on October 9, 1914, horror and devastation swept the kingdom. It was both alleged and denied that the invaders, infuriated by the resistance of the Belgians, had killed wounded men, fired on the Red Cross, violated women and little girls, mutilated some of their victims, and even made Belgian civilians of both sexes march in front of them as a screen; it was further alleged that towns and villages were given up to destruction and plunder, on the ground that the troops had been fired upon by the inhabitants. These allegations were affirmed by the Belgians, and emphatically denied by the Germans.

But the ruin of war fell upon Belgium. Visé was burned on August 15, 1914; Auschot four days later—it being charged that the young son of the burgomaster shot a German officer. After the defeat at Malines, the Germans retreated on Louvain on August 19, 1914, burning the villages en route. On entering Louvain, it was charged that the civil population attacked the Germans, and as a punishment they bombarded the town, and then set fire to it and with hand grenades to the houses that had escaped. The cathedral, the university buildings, and the famous library with a multitude of priceless manuscripts, including much early Celtic literature, were destroyed. A similar fate befell Audenne on August 20, 1914.

The reports of alleged atrocities greatly aided recruiting in England. They came as a shock to neutral nations, including the United States. On December 16, 1914, a committee was appointed in England, headed by Viscount Bryce as chairman, with Sir Frederick Pollock, Sir Edward Clark, K. C., Sir Alfred Hopkins, K. C., and Professor A. L. Fisher, an eminent historian, to investigate the charges alleged against the German army in Belgium. This committee's report was published in the spring of 1915, and the Germans published a reply.

Less than two weeks supply of food was reported in Belgium

on October 26, 1914. It was reported that 1,000,000 homes were uninhabitable, and practically there was no food in the country. The heroic little nation now faced starvation. It stirred the charitable emotion of the people of both England and the United States. Aid to the Belgians was given a great impetus when Germany reported on November 4, 1914, that she found it impossible to feed them. On November 6, the Belgian Relief Board was issuing 400,000 meal tickets daily. On November 11 the German Governor of Brussels issued a proclamation to the effect that food would be cut off from the people if they did not go to work. On November 27 the Belgian situation was reported as growing worse, and on December 4, 1914, the Relief Commission reported that 7,000,000 people faced famine.

By the end of January, 1915, the Belgians saw practically all their territory swept away by the Germans. On October 5, 1914, their Government had been driven from Antwerp to Ostend, and on October 12, 1914, to Havre, France. At the end of six months of the war, King Albert and his little army held only a small corner of the kingdom on the English Channel and French frontier.

The most important political development occurred after the occupation of Brussels by the Germans, when the latter claimed they had found evidence that Great Britain and France, with the consent of Belgium, intended to violate the neutrality of Belgium in any war that the Entente Powers might wage against Germany. England denied emphatically that the documents showed any such meaning as the Germans attributed to them. They were, she contended, only measures taken to protect the neutrality of Belgium.

We have seen how Turkey entered the war on October 31, 1914. Up to that day the Turkish Government was neutral. The peace party was headed by the sultan, the crown prince, and the grand vizier. The war party was guided by Enver Pasha, the Minister of War and Talaat Pasha, the Minister of the Interior.

The next morning, November 1, 1914, a declaration of war calling upon Allah for support in repelling "the brutal attack upon an innocent country," was issued in great pomp in the daily

papers of Constantinople over the signature of the Sultan, Mehmet V.

When the United States Ambassador, Mr. Henry Morgenthau, saw on October 30, 1914, that war could not be avoided, he went and exacted from Enver Pasha a definite promise to furnish a special train to convey out of Constantinople and European Turkey all members of the British colony who might desire to escape.

The train got away at the appointed hour, having on board nearly all the English colony that had been left in the city from the previous week.

From the very moment that war was declared a strenuous effort was made to inspire the Moslem population with the idea that it was a "holy war." On November 2, 1914, the plan was that all the Mussulman world was to rise and join with fury the splendid crusade for the spread of his pan-Islamic majesty, the German Emperor's military power.

The holy war with the spectacle of Christian Europe fighting against itself did not materialize. So the sultan and twenty Moslem priests issued an appeal on November 27, 1914, to the Moslem world to join the Djihad against England, France, and Russia. This appeal reached the Ameer of Afghanistan on December 1, 1914. He gave out a reply expressing his deep regret that Turkey was making war on England, the one nation which had saved her life through all the crises of the last half century. On this same day the Egyptian premier expressed himself as opposed to the idea of a holy war. On December 4, 1914, Turkey extended the holy war to include Serbia, where there was a considerable number of Mohammedans.

The Turks on December 4, 1914, seized the British consul in the Italian Consulate at Hodeida, Arabia, and carried him to a place unknown. Turkey promised to apologize to Italy for this act and release the consul, but failed to do so. Italy sent an ultimatum on December 10, 1914, giving Turkey two days to apologize and surrender the British consul. Turkey yielded.

On December 12, 1914, the German Field Marshal, General von der Goltz, until recently Governor of Belgium, was sent by the

German Government to assist the Turks in their efforts to fortify the Dardanelles against the coming attack of the Allies.

On August 9, 1914, Serbia declared war on Germany. On October 14, 1914, the Serbians recovered their capital, Belgrade, which had been captured from them by the Austrians. On December 6, 1914, the new cabinet, headed by Nikola Pachitch, the Premier, issued the important proclamation that Serbia would not make a separate peace from the Triple Entente.

Let us now briefly summarize the cost of the war during the first six months from August, 1914, to February, 1915. It has been estimated at various periods of time by such authorities as Dr. Theodore Wolf, Professor of Political Economy in the University of Berlin, and M. Yves Guyot, the best known and most widely quoted of the French economists. In determining what the war had cost in its first period it is estimated that the operating expenses had amounted to \$10,000,000,000, and that \$10,000,000,000 more must be added to this for loss by damage to property, loss to foreign and domestic trade, the vanished tale of the tourists, and the loss in the economic value of the killed and the permanently maimed and diseased.

At the end of January, 1915, the war loans of the nations at war had amounted to \$6,000,000,000, or a billion dollars per month; and another billion must be added for expenditures not provided for by loans. The warring nations and their neighbors, who were preparing to enter the war or mobilizing to avoid the war, had expended in round numbers about \$7,000,000,000. M. Guyot had calculated that the war at the end of six months had cost the nations of Europe in destruction of property, in loss of trade and in loss of life and deterioration of man-power the sum of \$8,500,000,000. Therefore, at the end of the first six months the war had cost the people of Europe the huge sum of \$15,500,000,000. At the beginning of the war the nations of Europe possessed \$400,000,000,000 of wealth.
